

PARTS & ACCESSORIES FOR YOUR

SPRITE & MIDGET

including technical advice and detailed schematics

moss-europe.co.uk | moss-europe.fr

WHEN ORDERING...

Remember, supplying details of your car, (i.e: engine, commission or VIN, LHD / RHD, year and any modifications) will save time and help us process your order correctly. We will be pleased to provide a full parts quotation, detailing price, availability and shipping costs, upon request.

SHIPPING & DISPATCH

Orders for delivery in the UK may be dispatched by regular post for small/lightweight items, larger items may be dispatched via a courier. Please call us for the best delivery option for your order and the latest delivery prices.

For delivery outside the UK we offer the following services. Economy delivery (by road): 2 to 5 days (approximately). Express delivery (by air): 1 to 2 days (Guaranteed). For small and low value orders we also use airmail. For these services, please ask for prices and the best delivery option when you place your order. Most deliveries (except airmail) are 'trackable', (inc: e-mail updates and internet access for selected carriers). Please remember, all carriage charges are dependent on either gross weight or volumetric weight, whichever is greater. If a quotation is required prior to placing your order, please contact a member of the sales department. Alternatively, you can arrange your own collection.

UK OPENING TIMES

Open Monday to Friday
8.30am to 5.30pm

Saturday
9.00am to 1.00pm
(Closed Sunday & Bank Holidays)

See website for Paris opening times

COLLECT FROM BRANCH

Why not reserve and collect your order from one of our branches?

ONLINE

If ordering online select the 'collect from branch/ arrange own pick up' option on the 'Delivery Method' page during checkout. Then select the branch you want to collect your order from. You will receive an email confirming your order and selected branch.

EMAIL

Send an email to sales@moss-europe.co.uk with the title of "Branch Collection". Your e-mail must contain the following information: Your full name, address, daytime contact number, desired branch for collection and part numbers.

COLLECTION

Our sales team will contact you when your order is ready to collect. You will then be able to collect and pay for your order at your requested branch during store open hours. On collecting your order you may be asked to confirm your address.

PRICING

Due to the volatility of world markets and currency fluctuations the prices in this catalogue are subject to change.

Moss make every attempt to keep prices competitive and stable, however in common with all other suppliers in our industry, we reserve the right to alter prices without prior notice. For the latest prices, please call or visit our website moss-europe.co.uk.

All prices are per unit (unless otherwise stated) and include (UK) VAT at 20% (where applicable). Please note EU countries may be charged at their local VAT rate, countries outside the EU will not be charged VAT. See the ordering information

or our website for further details. Prices are correct at the time of going to print, postage & packaging is not included. E&OE.

90 DAY MONEY BACK PEACE OF MIND WARRANTY

It's simple, if you change your mind for any reason, all uninstalled parts still in their original condition and packaging may be returned to us within 90 days from the date of purchase for a full refund. A copy of the original invoice or picking label must accompany the return. Return freight is paid by the customer, unless returned due to our error.

In the event of a part failing in use, all parts are warranted against defects in materials and workmanship for 12 months from the date of purchase. Please remember that all returns must be accompanied by the original invoice, return freight will be reimbursed. For more details see our website or contact your local branch.

Keep up to date with our latest news and tell us yours.

PAINT & COLOUR CODES (1967-79)

Here is a list of the colours used on the Late Sprite & Midget, please contact your nearest branch for Early models. The colours are carefully blended to be an exact match to the original paint as used by the factory, but it is worth observing that your car may well have faded from its original colour over the years. For this reason before you start, we recommend that you do a test spray of any aerosol on a piece of old metal or a carefully selected area of the car where a mismatch will not be noticed. The boot or spare wheel area is often a convenient place to do your testing.

We can supply paint in either aerosol or brush-on format (not for spray shop use). The aerosols come in 400ml cans and the brush-on paints are available in 125ml cans with a brush in the cap (except for engine and chassis paints, which are supplied in 500ml tins).

KEY TO PAINT CODES

Vermilion Red (118)
1978-79 CCRD118 (TU)

On the right are the paint colours applied to Sprite & Midget late models during production (see left).

- Vermilion Red - Is the colour name.
- (118) - The figure in brackets is the original factory paint code.
- 1978-79 - The dates refer to model years during which the paint was used.
- CCRD118 - Is the Moss paint code.
- (TU) - Means that a touch up option is available.
- *NLA - Means that the colour is no longer available from Moss.

Vermilion Red (paint code 118) was available for the 1978 to 1979 model year cars. It is available from Moss as an aerosol (part no. CCRD118) or as a touch up can (part no. CCRD118TU).

TRIM COLOURS (1967-79)

Moss supply trim for the Sprite & Midget, from complete interior trim kits right through to replacement door trim panels. Between 1967 and 1979, please contact your nearest branch for Early models. Designed by our own in-house trimmers, the Moss classic trim range has been produced to offer the classic car owner more contemporary choice when it comes to the interior of their cars. Available in a choice of standard colours, black, biscuit and nimbus. Biscuit is a pale beige colour, whilst Nimbus is a pale grey colour, both popular in many modern cars. Available as complete trim kits, that include seats, carpets and trim panels, for both Sprites and Midgets. Other colour ways are available to special order and include, red, autumn leaf, navy, ochre, beige and chestnut. Please note that seats, trim panel kits and carpet sets are available separately. Much time and money has been invested in producing exact replacement parts including the tooling to produce original heat formed patterns. Please see the colour chart below or contact Moss Europe for full details.

PERFORMANCE & TUNING

These pages contain a range of quality components that will generally improve the performance and handling of your Abingdon classic. Remember, before increasing the power output and speed of any vehicle, you should ensure that your brakes, steering, chassis etc... can cope with the modifications.

MOSS SPECIAL TUNING HANDLING KITS

The standard front suspension design allows body roll that induces instability. This can be rectified by fitting one of our well proven handling kits.

This kit includes a stronger front anti-roll bar with uprated centre mountings, plus uprated rear shackle bushes to reduce rear end steer caused by lateral spring movement.

Sprite and Midget (semi-elliptic rear springs)

Sprite III-IV, Midget II-III 11/16" dia. barTMK30850 . . .£86.00

Midget 1500cc (rubber bumper) 3/4" dia. bar . . .TMK30950 . .£111.00

FRONT ANTI-ROLL BAR MOUNTS

The degree of control the bar has over the vehicles behaviour can be adjusted by the use of different types of mounting for connecting the anti-roll bar to the chassis legs. We offer hard rubber or polyurethane bushes, depending upon the bar diameter and the use for which the vehicle is intended.

These hard rubber and polyurethane bushes fit with the original mounting straps, BHH2000 x1, available if required. For further detailed information please contact your nearest Moss branch.

Hard rubber centre mounts

For 9/16" diameter anti-roll bar (each)TMG3767 . . .£2.65

For 7/8" diameter anti-roll bar kitTMG30738SPK .£13.96

FRONT ANTI-ROLL BAR KIT

Sprite I-II and Midget I (drum brake models)

The under-steer on these models can be reduced by fitting the front anti-roll bar from the later disc brake models, however, this will require (if not already fitted) that you fit the later reinforced wishbones (listed here) along with the connecting links.

The connection to the chassis leg is a little difficult, but can be overcome with a little ingenuity. For a choice of anti-roll bars please refer to Sprite III-IV and Midget II-1500cc front anti-roll bars listed below.

Anti-roll bar conversion parts

Wishbone pan (2 required)AHA7029Z . .£68.50

Nut (6 required)GHF201 . .£0.08

Washer (6 required)GHF332 . .£0.20

Link RHAHA7011A . .£15.40

Link LHAHA7012A . .£15.40

FRONT ANTI-ROLL BARS

Sprite III-IV and Midget II-1500cc

An uprated front anti-roll bar will help you get the full cornering benefit from your classic, even if you haven't modified the suspension.

It is important not to fit too stiff a bar, as it will ruin the ride comfort.

Late cars were fitted with a 9/16" diameter bar as standard. We have found that the ideal anti-roll bar for a standard road car is 5/8" diameter, a modified car will handle better with a 11/16" diameter bar.

Our experience has shown that the original bar end stops are not required for competition bars, though they should be used on road bars. For further detailed information please contact your nearest Moss branch.

Standard 9/16" diameterAHA7013 . .£58.50

End stops for 11/16" diameter bars (2 reqd.) . . .11H462K . .£13.85

SUPERPRO UPRATED SUSPENSION BUSH KITS

The first stage in improving your suspension is to check all your bushes - there's no point buying springs and dampers if the bushes are worn out.

These suspension bushes improve the handling by reducing the amount of unwanted flex in the standard type of bush, leaving the suspension to move in the direction intended by the designers.

Polyurethane is the best solution for road use. It gives improved location without having a detrimental effect on noise levels or a harsh ride. Added advantages are improved longevity and unlike rubber it is not affected by ultra violet light, water, salt, oil or petrol. The Superpro bushes come with a steel sleeve and grease where necessary and are available either individually, as either front or rear sets or as a complete car set for your classic.

SPK21CK

SUPERPRO BUSH KITS

Save money and buy a Superpro bush kit for your car. Available as a complete car kit, front, rear or running gear kits. For vehicles with standard/original suspension layout.

Rear bush kitSPK21CR£59.20

UPRATED LEVER ARM DAMPERS

We supply new uprated dampers (as original fitment) outright which are built on the original Armstrong equipment. Each unit is tested to check its performance against the design parameters, and the valves are individually set to provide the correct hydraulic characteristics for the application. For some models, we also supply reconditioned units on a exchange basis.

If your standard lever arm damper units are in good condition, we stock competition valves should you wish to uprate them, as well as Penrite shock absorber oils so you can tweak your damping rates. Units are sold individually but should be fitted in pairs. The 25% uprated shocks work well on a road/fast road car.

MOTO-LITA STEERING WHEELS

Moto-Lita are among the finest replacement steering wheels available. Designed to enhance the appearance of the cockpit and provide an improved feel for the driver.

Available in a variety of styles, including polished or black painted spokes, with the option of polished wood or black leather rims.

Available in 13" to 15" diameters. Boss kits for each specified model of car are required for fitting (available separately).

Moto-Lita

See page A51 for more information

SMITHS GAUGES

A superb range of gauges in the 'Smiths' style with chrome bezel, and classic black faces with white numerals or magnolia with black numerals.

The following gauges are available:

- Clock (full face)
- Capillary oil pressure (half face)
- Electric water temp (half face)
- Dynamo ammeter (half face)
- Volt meter (half face)

- Boost gauge (full face)

All gauges come with bulb holders and retaining brackets.

The bezel (available separately) can be used to make the new gauges look as original as possible.

SMITHS

See page A49 for more information

MGS40904

TMG40901PR

UPRATED FRONT COIL SPRINGS

After fitting an uprated anti-roll bar and/or a telescopic damper conversion, the next stage of suspension tuning is to improve the springs. The Sprite and Midget range will benefit from an increase in front spring rate and lowering. The Frogeye Sprite is lighter at the front and will sit slightly higher on the springs listed here (standard springs are approx. 270lbs). The ride height can be fine tuned using spacers. It can be lowered by approx. 12mm with spacers between the spring seat and the wishbone (Part No: AJJ3322). It can be raised up to 10mm, in 5mm increments, using spring spacers.

We now offer our range of coil springs in a new modern specification

material, silicon chrome steel. This material is used in many current production cars and is lighter than the original chrome vanadium steel, which will help reduce the 'un-sprung' weight, ideal for fast road & competition cars. These new springs are only supplied in matched pairs.

How to measure ride height?

With your car on level ground, measure vertically from the centre point of each front wheel hub to the underneath of the wheel arch lip on each side and take an average value midway between the two in centimetres.

Chrome bumper models

UPRATED REAR LEAF SPRINGS

Sprite I-II, Midget I rear springs

As the original factory units are no longer available, we supply heavy duty replacement springs, which must be fitted in matching pairs.

Standard uprated original 1/4 elliptic springAHA5468£65.00

Sprite III-IV, Midget II-1500cc rear springs

We offer 1" lowered springs to reduce the tendency for the car to oversteer and to help level the car when lowered front springs have been fitted. For competition cars use a lowered and reversed rear spring dropping the car 2.5".

Sprite III-IV, Midget II-III (chrome bumper) rear springs

Lowered 1" fast road/sprintMGS40820 ..£107.60

Lowered 2.5" competitionMGS40821 ..£107.60

Midget 1500cc (rubber bumper) rear springs

Lowered 1" fast road/sprintMGS40920 ..£137.30

Lowered 2.5" competitionMGS40921 ..£114.80

ANTI-TRAMP BARS

The use of anti-tramp bars is highly recommended for cars which have more than standard power available. They are fitted between the rear spring front eye bushes and the centre spring mountings on the axle by special brackets - which are supplied as part of the conversion. When power is applied suddenly, usually from a standing start, the rear leaf springs tend to wind up into an S shape, and then revert to normal in a series of hops, referred to as tramping.

1/2 elliptic (1964-75) fast road/sprintTMG30930 ..£163.00

REAR SPRING LOWERING KITS

Sprite III-IV, Midget II-1500cc lowering kits (standard springs)

Lower your car with our lowering block kit. It fits between the spring and axle, effectively lowering the car by 1.5".

Lowering block kit (car set)TMG30920 ..£55.00

88G274SPK

UPRATED SUSPENSION BUSHES

These uprated suspension bushes are suitable for original suspension layouts. A much tighter feel for the handling can be achieved by fitting uprated suspension bushes, they can be a harder grade of rubber or polyurethane. Nylatron bushes are for competition only, they must also be fitted carefully to ensure the correct working clearance is obtained - and they must be inspected on a regular basis.

Sprite and Midget front suspension bushes

Nylatron's strength means for Sprite and Midgets we are able to offer the top trunnion bush with an offset drilled centre hole, this allows the suspension camber to be adjusted.

Front wishbone inner pivot bush kit poly (1 reqd.) .8G621SPK8 ..£42.10

UPDATED BRAKE PADS

When uprating your car one of the first steps is to uprate the brake pads. We stock a range of uprated brake pads for road and competition applications.

UPDATED FRONT BRAKE PADS

EBC Greenstuff brake pads are a high efficiency upgrade pad which will increase your car's stopping power by 20% over standard replacement pads. Tested in rally cars, these pads are high friction, fade resistant with immediate pedal response. The Kevlar based formulation is guaranteed to meet or exceed performance of all original equipment pads with strong progressive braking, reduction of dust on wheels and fantastic wear life.

EBC Greenstuff fast roadSTR505G£33.90

Mintex brake pads

Mintex M1144 is a hard wearing material ideal for fast road and track day use, giving good wear resistance and reduced fade under hard braking.

Mintex 1144 fast roadSTR5051£54.00

COPPER BRAKE PIPE KITS

These non-rust copper brake pipe sets are ready assembled with brass end fittings. The pipes are pliable for easy installation.

Brake caliper set

Brake calipers can corrode or rust over time or due to excessive use. Frequent on-off braking can also generate a lot of heat which will further reduce the lifespan of the brake calipers and other related brake parts. Old and worn brakes can seize up, which is highly dangerous on the road and a reason for MOT failure. These replacement calipers are an ideal solution to renew worn out calipers and restore efficient braking. Supplied in pairs.

Brake caliper set front (pair)17H9438/9 ..£82.00

DBD105

UPDATED BRAKE DISCS

Heavy braking can tax even disc brakes. Our cross-drilled discs are suitable for standard 2-pot calipers. They run considerably cooler than standard discs because they dissipate heat quicker than the solid versions. They also give more consistent braking under all conditions, therefore they are ideal for really hard driving or competition use.

Important note: If fitting grooved or cross-drilled discs to replace standard solid discs, they must be fitted as a pair.

Sprite and Midget cross-drilled (steel wheel) (each) . .DBD104£45.30
 Sprite and Midget cross-drilled (wire wheel) (each) . .DBD105£45.30

TT3949

REMOTE BRAKE SERVO KIT

For those who find the brake pedal rather hard after driving more modern vehicles, these remote servo kits make braking easier by reducing pedal effort. Suitable for all single line brake circuits they are remote mounted and easily plumbed into the hydraulic and vacuum systems of the car. We offer both a Lockheed and aftermarket kit, both are supplied with mounting brackets and hardware.

TMK30908

TMK30908A

FRONT TELESCOPIC DAMPER KIT

This renowned kit transforms the ride and handling of the Spridget. The suspension kit has been designed to overcome some of the weaknesses of the original suspension arrangement and give a more positive controlled movement of the suspension.

The kit includes a top arm assembly which replaces the lever arm damper, providing more torsional and lateral rigidity which has an immediate steadying effect on the handling of the car. This rigidity also improves the braking effect as the 'twisting' effect usually experienced under heavy braking is eliminated by the top arm.

The top arm has also been designed to give approximately 1 degree of negative camber to tighten up your Spridget's handling. The negative camber reduces understeer giving quicker cornering response and superior road holding. The telescopic damper unit has been chosen for its progressive damping, as the suspension movement increases the damping increases - this is not possible with a lever arm damper.

Telescopic damper kit TMK30908 . . .£560.00

Replacement front AVO dampers (pair) TMK30908A .£350.00

FLD30931

REAR TRACTION LINK

The RTL has been designed to meet the need for more axle control. This unique and innovative design provides three distinct benefits; improved traction, control of lateral movement and lower roll centre. The main bracket mounts to the underside of the car with rose-jointed outer arms locating on special mounts at the extremities of the axle.

Once installed and correctly set up the performance gains will be noticeable immediately. The car feels more stable, power can be applied earlier in the corner and traction is considerably improved. The RTL works well with the anti-tramp bar kit to give excellent axle location.

Rear traction link 'RTL' - semi-elliptic springs . . .FLD30931 . .£530.00

Rear traction link 'RTL' - quarter-elliptic springs .FLD30932 . .£530.00

PANHARD ROD KIT

FLD30933

The Panhard rod is designed to control the lateral movement of the axle relative to the body. This gives improved traction, no more tyre rub and an axle located in the centre of the car make a big difference to the driving experience. The car feels more positively located and easier to control, especially through the twisty bits.

This unique kit features a bespoke bracket that mounts to the boot floor clearing the fuel tank to give a rigid body mounting position and necessary brackets to mount to the axle. The Panhard rod works well with the anti-tramp bar kit to give excellent axle location.

Panhard rod kit - semi-elliptic springs FLD30933 . .£220.00

Panhard rod kit - quarter-elliptic springs FLD30934 . .£220.00

ANTI-TRAMP BAR KIT

This kit is designed to mount between the front spring hanger and the axle spring plate to prevent the axle 'tramping'. Tramping is when the axle twists the spring as drive is taken up, the springs then react and try to unwind causing a loss of traction and grip. Anti-tramp bars also ensure that the vertical movement of the axle is controlled. Anti-tramp bars work well with either the RTL or Panhard rod kit to give excellent axle location.

Anti-tramp bar kit - semi-elliptic springs only . . .FLD30930 . .£185.00

REAR DAMPER CONVERSION KIT

This rear damper conversion is like no other as it mounts the rear damper unit in a near vertical position. This puts the shock in the optimum position to absorb uneven ground while producing a smooth ride and far more rear end control.

To maintain front and rear continuity, adjustable AVO dampers are used allowing you to adjust the ride to your personal requirements and driving style. Combine this with our front telescopic conversion and you will experience a far superior and confidence inspiring car. Note: Requires welding.

Rear damper conv. quarter elliptic spring (1958-64) .FLD30937 . .£330.00

Rear damper conv. semi elliptic spring (1964-75) . .FLD309371 . .£300.00

UPRATED FRONT BRAKE KITS

FLD30948X

With a wide variety of kits your Spridget's brakes can be easily improved to suit your requirements. See our website for full details.

4-pot brake kit

Using Frontline's own 4-pot billet alloy calipers with either solid or cross-drilled discs allows you to rein in your Spridget more consistently and more safely than ever before. 4-pot calipers allow you to apply more pressure to a larger pad than standard calipers. The cross-drilled discs improve performance

by dissipating the build up of gasses between the pad and disc, reducing the tendency for brake fade, maintaining braking efficiency, even under hard braking. Supplied with EBC Ultimax brake pads.

This brake kit is suitable for all wheel sizes and is also available for bolt-on and knock-on wheel options. The calipers include full dust seals making this an ideal conversion for fast road cars.

4-pot brake kit - solid discs bolt-on wheels	FLD30950	..£840.00
4-pot brake kit - cross-drilled discs bolt-on wheels	FLD309501	..£910.00
4-pot brake kit - solid discs knock-on wheels . . .	FLD30951	..£840.00
4-pot brake kit - cross-drilled discs knock-on wheels	FLD309511	..£910.00

9" disc brake kit

With 9" discs and cast iron calipers this conversion brings Spridget braking right up to date at an affordable price. The kit is supplied with a pair of discs, brake calipers, pads, adaptor hubs, fitting kit and instructions.

Available with a choice of plain or cross-drilled discs. The cross-drilled discs improve performance by dissipating the build up of gasses between the pad and disc, reducing the tendency for brake fade, maintaining braking efficiency even under hard braking. Supplied with fast road pads. This kit is only compatible with bolt-on wheels.

9" disc brake kit - solid discs	FLD30948	..£490.00
9" disc brake kit - cross-drilled discs	FLD30948X	..£560.00

FLD30949

REAR DISC BRAKE KIT

This kit delivers the ultimate braking for the rear of your Spridget! The kit uses 8" discs with alloy calipers to allow rapid heat dissipation and reduced fade under continued heavy use and eliminates wheel lock under heavy braking.

The system has been designed to work in conjunction with any of Frontline's front brake conversions to give the optimum and most balanced braking set-up for your car. We would highly recommend the use of an upgraded master cylinder kit to realise the full benefits of the rear disc brake conversion.

Rear disc brake kit semi elliptic - 13" wheels . .	FLD309491	..£1020.00
Rear disc brake kit semi elliptic - 14" wheels . .	FLD30949	..£925.00
Rear disc brake kit 1/4 elliptic - 13" wheels . . .	FLD309492	..£925.00
Rear disc brake kit 1/4 elliptic - 14" wheels . . .	FLD309493	..£1050.00

Upgraded master cylinder conversion kit

This kit is designed to provide the extra fluid required with the rear brake conversion. If cars are being converted from drums all round to discs then this kit is not required. However, cars with front disc brakes will require this kit to reduce pedal travel, giving more confident braking.

Upgraded master cylinder conversion kit	FLD30952	..£250.00
---	----------	-----------

FLD30936

FLD30935

LSD & UPRATED HALF SHAFTS

Limited slip differential (LSD)

The limited slip diff allows you to drive normally around corners under light power conditions transferring power to the wheels as required. When extra power is passed through the differential and a wheel starts to spin, the LSD uses a system of plates and gears inside the unit to transfers more power to the wheel with more grip, reducing the 'free' wheel's tendency to want to spin. This gives you maximum traction and controllability all the time.

Limited slip differential	FLD30935	..£900.00
-------------------------------------	----------	-----------

Upgraded half shafts

These upgraded half shafts are made from EN40B steel, a very tough material which is well suited to the punishment the more enthusiastic drivers among us give these cars. Both the LSD and the upgraded half shafts use fine splines to greatly improve half shaft strength thus reducing the risk of failure.

Upgraded half shaft (each)	FLD30936	..£365.00
--------------------------------------	----------	-----------

FLD30938

REAR HUB DOUBLE BEARING KIT

This kit increases the strength and reliability of the rear hub by spreading the load over twin bearings as opposed to the standard single item. Highly recommended when upgrading engines and brakes.

Rear hub double bearing kit	FLD30938	..£510.00
---------------------------------------	----------	-----------

PECO SPORTS EXHAUST MANIFOLDS

PECO Peco have a well earned reputation for quality and stylish performance exhaust systems at an affordable price. Their range of performance manifolds and sports exhausts offer improved gas flow, as well as a great exhaust note.

PEX012

The 1098-1275cc A series engines respond well to a large bore sports exhaust giving improvements to both performance and torque. We offer two mild steel Peco manifolds, a long centre branch (LCB) system styled on the early 3-branch competition manifold, and a 3 into 1 design that really does move the exhaust gas. Both manifolds are designed to be used with our Peco sports exhaust system PEX014.

LCB mild steel manifold - 1098-1275cc PEX008 **£131.50**
 3-1 mild steel manifold - 1098-1275cc PEX012 **£125.23**

Specially designed for the Midget 1500cc this mild steel Peco tubular sports manifold is to be used with the Peco large bore sports exhaust system PEX016.

Mild steel 4-2-1 manifold - 1500cc PEX011 **£162.70**

TT10900

MOSS SPORTS EXHAUST MANIFOLD - 1500cc

MOSS This large bore manifold is a 4 into 2 into 1 layout, and is specially designed for our Midget 1500cc sports exhaust system (MGS50901). It follows the line of the standard system but uses a clamp fitting on the Y piece making it suitable for sports or standard systems. If fitting to standard system you will need clamp TT9932S. The manifold is supplied in three parts for easy installation.

Mild steel 4-2-1 manifold - 1500cc TT10900 . . . **£217.00**
 Manifold to head gasket - 1500cc GUG4041MG . **£2.84**
 Y piece mild steel - 1500cc TT109001 . . . **£42.00**
 Clips for Y piece (2 required) - 1500cc TT9932S . . . **£3.30**

MOSS SPORTS EXHAUST MANIFOLDS - 948-1275cc

MOSS Sports extractor manifolds improve gas flow by allowing the engine to breathe far more efficiently. Our sports exhaust manifolds are produced using mandrel bending equipment to give full diameter pipe bends. All our stainless steel manifolds are made in 304 grade stainless.

948cc

The A series 948cc engine does not work too well with a large bore manifold, we supply a suitable tubular performance version giving a welcome power boost whilst retaining torque. The area close to the chassis will need relieving to allow the manifold to clear.

The standard type exhaust can easily be shortened and fitted into the end of the manifold and clamped. Please see the Restoration section for exhaust system details and fittings.

Mild steel sports manifold - 948cc 12A191B . . . **£173.20**
 Manifold to head competition gasket - 948cc . . . TMG10836 . . **£4.21**

TMG10862

1098-1275cc

These A series engines respond well to a large bore sports exhaust giving improvements to both performance and torque. Our one piece manifold is the same as the original Leyland competition unit. The area close to the 1098cc chassis will need relieving to allow the manifold to clear.

To obtain maximum power we suggest you use our sports exhaust system MGS50801. If fitting to a standard exhaust it is necessary for the down pipe of the system to be cut to suit the new joint position.

CSI-IGNITION DISTRIBUTORS

CSI-Ignition distributors offer a fully electronic ignition system built into the correct type of Lucas distributor housing to suit your car, keeping the original appearance in the engine bay. You can only tell the difference when you remove the distributor cap!

Gone are the points and condenser and mechanical advance mechanism, all replaced with a high quality electronic ignition system manufactured using military specification components for durability and reliability. These distributors are maintenance free (no points to adjust), and offer the benefits of, easier starting & smoother running, more torque & power, reduced fuel consumption & emissions. They also eliminate the weaknesses of mechanical timing advance and problems such as points bounce ensuring correct ignition timing throughout the rev range.

“The new range of CSI-Ignition distributors is a breakthrough for classic car ignition systems”.

Each CSI-Ignition distributor features 16 easily switchable, optimised ignition curves to allow timing adjustment to suit your car's engine and fuel specifications. Alternative advance curves can be selected to suit your engine's state of tune making them ideal for modified engines. Curves are easily selected using a screwdriver in a rotary switch, with a bright flashing LED indicator to show the selected curve all concealed underneath the distributor cap. The distributors are also available with an electronic immobiliser system to prevent unwanted starting of the engine. Installation is straightforward. As the CSI-Ignition distributor uses the correct type of distributor body for the application it is a direct swap. Full instructions and ignition curve selection guidance is included.

We offer a wide range of CSI-Ignition distributors for a variety of applications. They are available Optimised with vacuum advance to suit road or uprated cars running on SU carburettors, or Tuned without vacuum advance for cars running Weber type carburettors. Please note: Some units may only be available To Order. More details are available on our website. Search for CSI-Ignition Distributor.

LUMENITION IGNITION

Lumenition

CEK150

Lumenition electronic ignition kits are well known as being among the finest aftermarket electronic ignition systems available. This system basically replaces both the contact points and condenser with an optical switch and power module. The power module is an electronic device that receives a pulse from the optical trigger which switches the coil. The trigger eliminates contact bounce, arcing, mechanical wear and spark scatter, reducing maintenance and increasing reliability. With minimal wiring and modifications this kit is very discreet.

Note: Installation of a power module requires a distributor fitting kit.

A performance ignition kit is available, it includes a power module and a high output coil. The microcircuit control of the coil current gives optimum performance across high engine speed ensuring maximum spark energy at the coil. A fitting kit, to suit the distributor application, is also required. Positive earth wiring instructions are available from your nearest Moss branch. Please check your distributor type before ordering the fitting kit as many cars have non-original distributors fitted. The identification number is cast on the distributor body.

Ignition kit: Includes high energy coil and performance power module.

PERTRONIX IGNITION

These completely self contained electronic ignition units offer a simple alternative to traditional points and condenser arrangement. They are easy to install with no external control boxes to mount and only two wires to hook up and no permanent modifications involved. The unit uses a sealed Hall Effect sensor that is impervious to dirt, dust, moisture, or vibration and retains standard advance curve. Unaffected by distributor shaft wear, maintains firing accuracy to within 1/4°, reduces spark scatter over the full rpm range. One year warranty.

LUCAS

UPDATED PERFORMANCE LUCAS DISTRIBUTORS

Our performance distributors feature a modified advance curve and updated points to suit a tuned engine, particularly with a performance camshaft fitted. If you have a modified engine using Weber carburettors we recommend using the no-vacuum type. We also recommend you change your plugs to a higher heat range, see page A16. For further details please contact a Moss branch.

BATTERY CUT-OFF SWITCHES

Battery cut-off switches are a good idea for all cars. Fitting one enables you to quickly isolate the battery and immobilise the car; ideal when working on your car, or if you intend to put your car into storage. Use with a battery conditioner, see our website at moss-europe.co.uk

Battery mounted cut-off switches

These cut-off switches simply mount to the battery post and feature a screw-in knob to break the circuit. Available with a bypass fuse to allow sufficient current to pass to operate clocks, alarms and coded radios, but if any attempt is made to start the car the fuse will blow.

Battery mounted cut-off switchGAC3192X£6.46
 Battery mounted cut-off switch with bypass fuse .GAC31921 ...£9.50

In-line cut-off switches

These cut off switches need to be fitted into the main battery to starter cable. The body of the switch should be mounted securely to the car and cables fitted using the terminal kit.

Period cut-off switch

These are reproductions of the Lucas 'Battery Master Switch' which was a popular accessory on many British classics.

SMOOTH CUT REV LIMITERS

These rev limiters could save you from an expensive bill. Designed to allow full use of power up to maximum revs, where they will not exceed the preset limit. They work by progressively miss-timing the spark preventing an increase in engine speed from over revving due to missed gears or over exuberance.

SmoothCut rev limiter 4 cylinder preset 6000rpm .TT2987£110.00
SmoothCut rev limiter adjustable limitRL5£155.00

NON-LEAK BATTERY

Suitable for most 12 volt applications it is a totally sealed, maintenance free battery that will not leak, even if split. The acid is completely absorbed into glass mat separators between the plates. Other advantages are that as there is less internal resistance it offers more cold cranking capacity than a conventional wet battery. It is also more resistant to heat and vibration and has a slower self discharge rate than a wet battery (loses 2-3% a month as opposed to a wet battery losing about 15% a month).

Great in any car, particularly good for sports or competition due to its small size (20cm x 20cm x 13cm). Its unique design means that it can be shipped by mail order.

Non-leak batteryMXV1129X .£140.00

BATTERY TRAY/LINER

This clever item, completely hides all but the most terminal symptoms of battery box plague. Ribbed for extra strength, this battery tray not only protects against corrosion, but also makes cleaning around the battery easier. This will only fit early models due to the different heater arrangement in later cars.

Battery tray/liner (to 1967)AM7301£35.00

KLINGERSIL GASKET

Manufactured from a modern high performance synthetic material these gaskets can withstand much higher temperatures (up to 400°F) and extreme pressures (up to 750psi) making them ideal for fast road and competition engines.

REVOTEC COOLING FAN KITS

Keeping your Spridget's engine running at optimum temperature will ensure you get the best performance and economy. Revotec and Moss Europe have co-designed these high quality bespoke fan kits for the Sprite & Midget range.

"high quality bespoke fan kits for the Sprite & Midget"

Using the latest high efficiency fans with adjustable electronic controllers these kits are designed to replace the standard original mechanical fan, reducing the load on the engine, noise and improving both power and mpg.

Unlike other fan kits that use universal mounting systems, these kits fit using bespoke laser cut brackets that mount directly to the radiator cowl using existing mounting bolts. A manual override switch is also available separately, enabling manual control of either On, Off or Automatic. Kits include: High efficiency fan assembly, electronic controller, bespoke brackets, hardware & wiring and full instructions.

The kit for early Spridgets with a vertical flow radiator, uses Revotec's special 'pull through' mounting system. This kit includes special ties that pass through the radiator core to hold the fan assembly in place. Foam pads are included that prevent damage to the radiator core. All kits also use a precise electronic controller to enable easy adjustment to suit your car.

OIL COOLER INSTALLATION KITS

Oil thins as the temperature increases, thinner oil reduces oil pressure and is less effective at preventing metal to metal contact. Longer journeys or driving at sustained high speeds, tends to exacerbate the problem. Fitting an oil cooler minimises this effect and helps prevent engine damage. Kits come with mounting brackets and unions in a variety of styles. Thermostatic kits include a thermostat so the oil does not go through the cooler until it reaches operating temperature, giving quicker warm up. The radiator is supplied separately so you can choose the most appropriate size for you.

OIL THERMOSTATS & GAUGE ADAPTORS

TT29602

Use one of these thermostats if you already have an oil cooler kit fitted without one. The standard thermostat has push fit connections for use with rubber hoses. It completely seals off the oil radiator until the oil temperature reaches 74°C. The full flow thermostat has 1/2" screw in connections for use with stainless hoses. It works by diverting the oil through the thermostat until it reaches 74°C. The temperature gauge adaptors fit into an oil line and allow the fitting of an oil temperature gauge. You can choose between push on connections for rubber hoses or screw in connections for braided stainless steel hoses.

Standard oil push on thermostat TT2960 . . . **£46.20**
Full-flow oil screw on thermostat TT29602 . . **£139.80**

5 SPEED GEARBOX CONVERSION

Frontline Spridget five-speed conversion for all Sprite & Midget models is a complete replacement kit with every-thing you need to achieve modern day driver comfort and performance. The ultra-smooth action of the five-speed gearbox is an instant benefit.

With a synchromesh first gear and quieter reverse the vibration and hassle are taken out of town driving. With similar ratios from first to fourth, the performance through the gears is unaffected, and the added benefit of a 0.82:1 fifth gear gives a reduction of 1,200rpm at maximum speeds, giving faster and more relaxed cruising.

“The ultra-smooth action of the five-speed gearbox is an instant benefit.”

The robust gearbox and roller release bearing clutch arrangement replace the weaker original system, giving an almost maintenance free transmission. The conversion involves minimal cosmetic or structural changes and the specially

modified gear change puts the gear lever in the original position, with no modifications required to the upper area of the tunnel.

Kit includes: Fully reconditioned gearbox, replacement bell housing, clutch mechanism, chassis crossmember, speedo cable, hardware and instructions. Please see website for replacement parts.

REVOTEC COOLING FAN KITS

Keeping your engine running at it's optimum temperature will ensure the best performance and economy.

Revotec and Moss Europe have co-designed these high quality bespoke fan kits using the latest high efficiency fans with adjustable electronic controllers. These kits are designed to replace the standard original mechanical fan, reducing the load on the engine, noise and improving both power and mpg.

Unlike other fan kits that use universal mounting systems, these kits fit using bespoke laser cut brackets that mount directly to the radiator cowl using existing mounting bolts.

See page A18 for more information

C-AJJ3319

CLOSE RATIO GEAR SET

Close ratio gears are designed to keep the engine working in the power band curing the problem of the engine coming ‘off cam’ between the ratios, keeping the engine speed in the power band.

These straight cut gears provide increased reliability through being substantially stronger and it takes less power to drive than helical gears. Being straight cut makes them considerably noisier than helical gears so they are recommended primarily for track use. The standard first and reverse gears are retained. Available for rib-case gearboxes only.

Gear ratios	1st	2nd	3rd	4th
Standard ratios	std	1.916:1	1.357	1.0:1
Close ratios	std	1.722:1	1.255	1.0:1

Straight cut gear set - 1275ccC-AJJ3319 ..£400.00

QUAIFE LIMITED SLIP DIFFERENTIAL

Quaife limited slip differentials allow maximum drive to the wheels, giving more grip under hard acceleration and cornering. Power is distributed to both wheels, rather than wasting energy spinning the wheel under the least load.

The Quaife differential is gear operated, so it has no plates to wear, and automatically transfers power to the wheel with the most grip. The plate type is a traditional Salisbury type differential, it has a set of clutch plates inside the housing that divert power to the wheel with the most grip.

Quaife limited slip differentialTMG20820 ..£1130.00

SUPERCHARGER HEAT SHIELD - 1275cc

Help keep your Supercharger (150-080) keep cool for greater efficiency and longer life. Three piece kit of high tech reflective material protects the supercharger and manifold from exhaust heat. Lower temperatures mean more power and fewer tendencies for detonation to occur at higher boost pressures.

Supercharger heat shield set150-086£118.91

SUPERCHARGER KIT - 1275cc

The new Sprite/Midget supercharger system uses the same Eaton positive displacement roots-type supercharger found on contemporary OE applications such as Mercedes Benz and Jaguar. In spite of its modern origin, Moss was careful to design the system to look like it was a factory-installed option that complements the classic Sprite/Midget image. The supercharger features helical rotors and an internal vacuum controlled bypass valve for high efficiency and economic cruising.

The kit will install on any 1275cc Sprite/Midget in-line engine and will fit with either a generator or alternator. We do recommend upgrading to an alternator as the generator bearings will wear quickly with the increased belt loading. We also offer an alternator conversion kit that will fit any of the A-Series engines (no provision for Frogeye mechanical rev counter).

Note: The installation of a supercharger will exploit all the strengths of your engine to give you maximum power. However, it will also exploit any weaknesses of your engine. These systems are designed to supplement an engine in good condition, not make up for lost power in a tired one. If your car has an old, tired engine you will want to overhaul it first.

Supercharger kit - 1275cc150-080£3350.00
Alternator conversion130-108£106.90

BTA939

UPRATED HALF SHAFTS

The weak spot on the back axle is the half shaft, we can supply uprated EN40B Nitrided steel half shafts, so broken shafts should now be a thing of the past.

Uprated half shafts - steel wheelsBTA940£245.00
Uprated half shafts - wire wheelsBTA939£128.38

TMG2930K

HIGH CAPACITY FUEL PUMPS

The standard fuel pump may not be able to maintain adequate fuel flow and pressure at higher engine speeds, particularly with a tuned engine. The Facet range of fuel pumps will suit all standard and modified engines fitted with carburettors. They give constant fuel flow and pressure, even at high temperatures eliminating the problems associated with vapour lock. The pumps are available in a variety of specifications to suit the engine's fuel pressure and flow requirements. Further fine tuning of the fuel pressure can be easily achieved by the use of a separate fuel regulator, see right. With safety in mind we recommend fitting a fuel pump inertia switch kit, so that in the event of an accident fuel delivery is automatically cut-off. Fuel lines may require adapting to install the new pump, check pipe sizes to select the correct unions, additional unions may be required.

Cylindrical fuel pumps

Formerly known as interrupter type pumps, these heavy duty pumps can be fitted at the front or rear of the car and up to 600mm above the bottom of the fuel tank. Kits are supplied with mounting & 8mm unions, alternative size unions available.

Cylindrical fuel pump kit - road Silver Top TMG2930K . . .£96.00
(Up to 150bhp, flow rate: 30 gal/hr, 4.0-5.50 psi, unions: 8mm x 1/8 npt)

STELLING & HELTINGS AIR FILTERS

Stelling & Hellings air filters were a popular aftermarket air filter used on many American hot rods & sports cars. Their filters were supplied as original equipment on the 427 Cobra. These exact reproductions are chrome plated with a mesh filter. A smart accessory for your Sprite or Midget.

Stelling & Hellings air filter - SU 1 1/4" carbs (each) .223-100£39.00
Stelling & Hellings air filter - SU 1 1/2" carbs (each) .223-200£39.00

LOGO AIR FILTERS

Enhance the appearance of your SU carburettors and engine bay with these chromed MG & SU logo'd air filters. Fit 1 1/2" carburettors.

MG logo air filter each - 1500cc onlyGAC1055X ..£54.70
SU logo air filter each - 1500cc onlyGAC1078X ..£54.70

BREATHER FILTERS

Engine breather filters are an alternative to running pipes from crankcases, clutch housings and timing cover breathers to the inlet manifold, they are particularly useful if induction set ups have been changed. Filters simply push on and are retained by a hose clip. Just remember to block off the other fitting on the carburettor or air filter where the original pipe was attached.

K&N crankcase breather filters

- 1 Breather filter 2" diameter 1/2" external inlet .KN62-1010 ..£22.10
(Filter has 1/2" (12mm) OD metal inlet stub to fit into 1/2" (12mm) ID breather hose).
- 2 Breather filter 2" diameter 1/2" internal inlet .KN62-1330 ..£20.40
(Filter has 1/2" (12mm) ID rubber inlet to fit onto 1/2" (12mm) OD breather pipes).

SU CARBURETTOR INLET MANIFOLDS

LP4012

1098-1275cc

Cast aluminium inlet manifolds, supplied complete with studs and nuts. For further details please contact your nearest Moss branch.

1098-1275cc (twin HS2/HS4)	LP4012	£157.50
1098-1275cc (single HS6)	MT3603	£55.90

**1500cc**

Cast aluminium inlet manifold with water heated pipe, supplied complete with studs and nuts to mount a pair of HS4's.

1500cc (SU HS4)	TT1458	£181.00
-----------------------	--------	---------

WEBER CARBURETTORS & COMPONENTS

Increasing the size and number of carburettors can unleash a lot more power if the right combination is chosen. For maximum power and performance Weber side-draught carburettors are the best option. The improvement in mid to top end breathing is considerable. The jetting may need some adjustment, depending on the engine specification, this is best achieved on a rolling road. With some installations when using Weber carburettors, the inlet manifold no longer supports a closed circuit engine breather system. All our Weber carburettor inlet manifolds are supplied with fittings and seal plates. For full details please contact your nearest Moss branch.

**A series engine**

The inlet manifolds here, allow space for the fitment of either deep or slim K&N air filters and are long enough to greatly improve breathing.

Medium manifold 10cm	TT10850	£148.20
----------------------------	---------	---------

(10cm is the popular length for RHD cars with deep K&N filters, LHD models, and most road cars in general).

**A series engine**

Long manifold	TWM0071	£321.00
---------------------	---------	---------

(Made by TWM and supplied complete with direct action throttle linkage).

**Midget 1500cc**

A single 45 DCOE will give a good power increase across the rev range. A twin 40 DCOE set up gives more top end power at the expense of bottom end tractability. Twin 45 DCOE's are for full race use only as there will be no bottom end torque.

Parallel manifold single carburettor	TWM0088	£280.00
--	---------	---------

(This parallel TWM manifold gives maximum flow so will give more power at the top end. This manifold is 12cm long so you can use up to a 63mm deep air filter. Supplied as a ready to fit kit with necessary linkages).

**Midget 1500cc**

Cross-over manifold single carburettor	TT10549	£108.00
--	---------	---------

(This manifold will give improved mid range due to the better distribution of gases. This manifold 15cm long only allowing a 45mm deep air filter).

**Midget 1500cc**

Short tract manifold twin carburettor	TT1450	£210.00
---	--------	---------

(This pair of manifolds is designed where space is limited or when using deep air filters. K&N filters KN56-9265 may be fitted, space allowing, along with 26mm ram pipes. This set up produces a wide usable power range).

**Midget 1500cc**

Long tract manifolds twin carburettor	TT1350	£137.00
---	--------	---------

(This pair of long tract inlet manifolds allow for maximum power. They can only be used with 45mm deep air filters).

WEBER DCOE THROTTLE LINKAGES - MANGOLETSI

This new simple design, for DCOE carburettors, features a cast bracket which fits over the top of the carburettor, holding the linkage neatly to the side of the carburettor. This unique design has an ultra-low profile - the highest point of the linkage is only 10mm higher than the carburettor, ideal if clearance is limited. Each kit is suitable for single or twin carburettor set-ups for in-line engines.

The unique design also gives a wide range of throttle adjustment. Cable travel and spring tension can be adjusted independently. The adjuster can be set to give the desired cable travel, the spring tension can then be set to give the correct throttle shut off. This allows the throttle feel to be fine tuned to the driver's requirements.

Throttle linkage DCOE - single cableLP42411£86.45

WEBER DCOE THROTTLE LINKAGES - WEBCON

These high quality linkages are available for Weber DCOE side draught carburettor. The main bracket, lever and fittings are manufactured from zinc plated steel which gives excellent corrosion resistance and matches other components on the carburettor. They feature a self-lubricating bronze pivot bush, twin return springs and high quality ball joints, giving a smooth operation. They are suitable for single or twin carb set ups and are fully adjustable. Kits are available for top or bottom mounting, with a choice of single or twin cables. Single cable kits are supplied with a ferule to attach to existing throttle cable. Twin cable kits include a pair of cables, with pedal end fitting block.

WEBER CARBURETTORS

These are some of the Weber carburettors that we have available. A single Weber set up is ideal for road use giving a good power increase, twin Weber's will give you a substantial increase in power. We can supply different jet set ups according to your needs, please discuss this with us when placing your order.

UPRATED CYLINDER HEAD FASTENERS

You should consider the strength and reliability of all critical fasteners used on your engine. Increased reliability can be obtained for mild states of tune by replacing the head studs and nuts with uprated versions.

The greater strength of these studs will restrict stretching under pressure and therefore keep the head and gasket securely in place. Remember, just a simple nut and bolt check could prevent "shake, rattle and break"! Use these to help keep your cylinder head gasket in one piece.

ALUMINIUM CYLINDER HEADS (STANDARD)

Working to original drawings, these brand new cylinder heads are designed to the original factory specification.

When fitting an aluminium head, you must run with 100% summer coolant that contains the correct inhibitors to prevent corrosion and electrolytic reaction. We recommend you use new hardware, nuts, studs, etc... when fitting these heads to ensure a good fit.

All our 5-port heads are supplied as fully machined bare heads, with bronze valve guides and lead free valve seats. Heads can be modified to a higher specification. For detailed specifications please call your nearest Moss branch.

PERFORMANCE ENGINE UNITS

If you don't have the inclination to prepare, modify or build the engine yourself, we can build it for you. We also offer a wide range of high quality standard engines for all Abingdon classics. Please see the Restoration section or contact your nearest Moss branch for full details.

Here are some of the more popular options, although we can build an engine to your exact specification. Please talk to your nearest Moss branch for details. (All our engines are fully balanced complete with clutch and flywheel).

Note: A refundable surcharge will apply to all units unless the customers own unit is supplied for modification.

1275cc stage 2 performance engine

If you wish to improve performance, then our stage 2 engine is your answer. Cylinder head modifications include gas flowing of the ports and chambers, standard size reshaped valves, re-cut valve seats, new guides and double valve springs. Engines are supplied less rear engine plate, water pump and front pulley. All engine units come with slave rocker cover.

Stage 2 performance engine - 1275ccRKM1126ST2 ..£2750.00

1500cc performance engines

This really is the easy way to give your Midget 1500cc extra performance. We offer a standard balanced engine as well as a stage 2 fully balanced engine. Both units are lead free. All work is carried out to the customers own unit. Price quoted excludes external ancillaries.

Standard/balanced engine - 1500ccGSE2459BFC£1990.00

Stage 2 performance engine - 1500ccGSE2459ST2 ..£2570.00

ROCKER COVER NUT WITH MG LOGO

Our polished rocker cover securing nuts feature the MG logo in solid brass. They are the perfect finishing detail to any engine bay and look great on any rocker cover.

Rocker cover nut (each)460-119£24.00

MODIFIED CAST IRON CYLINDER HEADS

TMG10803B

Our range of gas flowed heads are available to suit all needs. On some heads the work is carried out to the customers own unit, the more popular heads may be available on an exchange basis. All heads are supplied with bronze-alloy valve guides and valve seats suitable for use with unleaded petrol unless requested otherwise. Please advise us of the engine capacity and any planned improvements/changes at the time of ordering.

Stage II

Fast road heads include gas flowed ports and reshaped combustion chambers. New reshaped standard valves are fitted with new guides and uprated valve springs.

Stage III

Fast road/sport heads have further modifications to the ports and chambers. Large inlet valves are fitted with new guides, uprated valve springs and alloy valve caps.

Stage IV

Race heads are competition based heads with extensive modifications to ports, valve seats and chambers. New large inlet and exhaust valves with Moss ST valve springs and alloy caps. Not available with lead free valve seats. Work is carried out to customers own head, we will need full details of your engine to achieve the optimum compression ratio.

HIGH PERFORMANCE ROLLER ROCKERS

The roller rocker kit replaces the complete rocker assembly. The advantages of having roller tips are lower friction, less side loading on the valves and the ability to withstand the stresses of high rpm without breaking. Using a higher rocker ratio is ideal for increasing the valve lift and improving torque, best combined with a hi-lift camshaft.

The ratio of our roller rockers means the valves are opened earlier for a longer duration, making breathing far more efficient. If using rockers with a higher ratio it is vital to check the valve springs for coil binding when a high lift camshaft is fitted.

Note: Tubular push rods must be used with roller rockers, and for Midget 1500cc a rocker oil feed kit (TT1226) must definitely be fitted.

Roller rocker set 1.5:1 - 948-1098cc	AHT440	NCA
Roller rocker set 1.3:1 - 1275cc	AHT437	NCA

Rocker oil feed kit - 1500cc	TT1226	£35.00

UPGRADED ROCKER SHAFTS & FITTINGS

All cars will benefit from a tuft-ridged rocker shaft, particularly tuned cars using higher revs. They are stronger, so will resist wear and prove more reliable. Tuft-ridged rocker shafts must be thoroughly cleaned of the salts used during the hardening process.

As with all rocker shafts check the end plugs are in place before fitting. The friction and side loads on the rockers can be reduced and the location improved by using a steel spacer set instead of the rocker shaft springs.

Midget 1500cc need pedestal shims with standard rockers enabling the correct rocker angles to be obtained. They have a nominal thickness of 0.032" and are supplied individually.

A series tuft-ridged rocker shaft	TMG10817	£27.60
A series steel spacer set	CAEG392	£16.15
Midget tuft-ridged rocker shaft - 1500cc	TT1317	£27.70
Midget steel spacer set - 1500cc	TT1318	£13.40
Midget pedestal shims (as required) - 1500cc	TT1910	£2.15

UPGRADED VALVES & VALVE GUIDES

Our high-flow and gas-flow valves, made from EN21/4N stainless steel, are essential to maximize the flow of gases through the head. These valves should be fitted with our bronze alloy valve guides for improved reliability with less friction, especially when running with unleaded petrol.

Rimflow valves are considered to be the best valves on the market. Also produced in EN21/4N steel, they have chromed plated stems to enable them to be installed with iron guides, we recommend bronze guides as these help with heat dissipation. Rimflow valves use single groove collets (88G459). Choice of valve size will depend upon the torque or high revs required, this must be considered with camshaft and rocker gear choice. Larger valves with suitable modifications can increase power output by up to 8 bhp.

High-flow large inlet valve (35.6mm) - 1275cc	CAEG544	£19.00
High-flow large inlet valve (37.2mm) - 1275cc	CAHT55	NCA
High-flow large exhaust valve (29.4mm) - 1275cc	CAEG106	£14.80
High-flow large exhaust valve (31mm) - 1275cc	CAEG107	£16.70

High-flow large exhaust valve (1.30") - 1500cc	TT1435	£29.50
Bronze valve guide (set of 8) - 1500cc	TT1419	£67.00

UPGRADED VALVE SPRINGS & CAPS

Competition valve springs work well with either a tuft-ridged rocker shaft or high ratio rocker gear, as well as performance camshafts and, depending on specification, are good to 8000rpm, but they must be used with our alloy caps. Half the weight of steel, our lightweight alloy valve caps will help minimise wear on the valve gear and cam. For Sprite, Midget 1275cc engines alloy valve caps must be shimmed (with MGS101861 spacers) to the correct fitted height.

Upgraded valve spring set fast road - 1275cc	TMG10807	£37.15
Valve spring spacers - 1275cc	MGS108161	£36.50
Alloy valve cap set - 1275cc	TMG10816	£14.40
Upgraded valve spring set fast road - 1500cc	TT1307	£32.00
Alloy valve cap (each) - 1500cc	TT1216	£5.70

UPGRADED PUSHRODS & CAM FOLLOWERS

Our lightweight (40g) cam followers are the type with extra drain holes, they allow high revs while reducing loads on the camshaft. Our lightweight tubular pushrods are stronger than the originals and are made to suit a high compression cylinder head. When fitting upgraded push rods and cam followers you are advised to fit them in engine sets.

Upgraded push rod (8 required) - 1275cc	AEG314	£3.00
Lightened/tuft-ridged cam followers (set) - 1275cc	CAEG579	£47.20
Lightened/tuft-ridged cam followers (each) - 1275cc	TMG10709	£7.70
Tubular push rods (8 required) - 1500cc	TT1433	£8.60

UPDATED CAMSHAFTS

To assist in selecting a suitable camshaft we have prepared tables showing their various characteristics, these will change from engine to engine and with other modifications such as carburettor or valve size. A scatter profile is where the cam timing on No.2 and 3 cylinders has been altered slightly to combat the poor scavenging of the Siamese port design. This will benefit both the tickover and high end performance.

Care must be taken when choosing your camshaft and other components, to ensure you get the best out of them. For the more extreme camshafts you will need a flowed head with bigger valves and the fuelling will have to be modified to suit, either with SU's or Weber carburettors. If you want to minimise other modifications use a mild camshaft. If you are considering fitting one of our supercharger kits, please contact our Research and Development department at our London branch.

948-1098cc

All the Kent camshaft applications/part numbers here for 948cc and 1098cc have the suffix 'P', they are for the original Pin drive oil pump/camshaft as used on 948cc and 1098cc models. If you have changed your camshaft and oil pump to either Star drive or Metro slot, use the suffix 'S' or 'M' on the part number.

LIGHTENED BODY PANELS

Jim Clark was probably the quickest Grand Prix driver of the early 1960s. When asked how he drove so quickly, one word was adequate "concentration". His boss, Colin Chapman might have hoped it was his lightweight Lotus F1 cars.

These fibreglass body panels are suitable for all Sprite & Midget models except for Sprite I.

Complete front end (one piece)	TMG70801	£300.00
Bonnet unit with inner frame	TT70907	£140.00
Front wing RH	TT70906	£97.20
Front wing LH	TT70905	£97.20

DUPLEX CHAIN KIT & VERNIER TIMING GEARS

It is preferable to change from a single row chain (simplex) to twin row chain (duplex) as the twin chain is less prone to stretching. The cam timing can also be optimised via an adjustable vernier cam gear, or by using offset cam keys. Please see manufacturers data for correct timing figures.

Advancing camshaft timing - making the full inlet valve lift occur before the rotation angle specified by the manufacturer, makes the engine produce more torque lower down the rev range while losing very little top end power.

Duplex conversion kit - 948-1275cc	AJJ3325	£27.40
Vernier camshaft gear - 948-1275cc	TMG10828	£113.00
Duplex conversion kit - 1500cc	TT1428	£78.00
Vernier duplex conversion kit - 1500cc	TT14281	£163.00
Replacement vernier camshaft gear - 1500cc	TT1225	£124.24

OFFSET CAMSHAFT TIMING KEYS

These keys are required by most performance cams, they must be used in some race classes if vernier gears are not permitted. The kit of three keys with 2°, 4° or 7° offsets, permits a choice of angle of fitment. The individual keys offer angles of offset from 1° through to 9°. Please see manufacturers data for correct timing figures.

Note: These timing keys are not suitable for Midget 1500cc engines.

Cam gear locating key kit (2°, 4° and 7° offset)	MGS10725	£28.00
Cam gear locating key 1° offset	MGS108251	£9.73

WORKS STYLE

H4 HALOGEN HEADLAMP CONVERSION

For a powerful superior light beam and pattern, fitting modern halogen headlamps is one of the most worthwhile upgrades you can make to your classic.

Our kits include two light units and two 60/55w halogen bulbs. You can fit standard H4 bulbs, or replace them with blue tinted, or

super white xenon. Super white xenon are approx. 30% brighter.

See page A41 for more information

FUEL CAPS

Tourist Trophy MG locking fuel cap

Chrome reverse lamp rim and lens kit (car set)37H7512CRK . . .	£26.40

LED TAIL LIGHT KIT

This LED kit means classic cars no longer need to compromise on safety and visibility. The immediate, intense light the LED's produce transforms your brake lights from wispy candles to high-powered beams. The design intentionally places the individual LED's so that they replicate the original pattern as closely as possible, in respect to the heritage of these classics. Fitting requires drilling of a couple of small holes and this is for negative earth cars only.

LED tail light kit143-810	£84.50

CAR COVERS

Protecting your cherished classic with a car cover will help to keep the paint, hood and brightwork in the best possible condition and safe from the elements.

Whether you need a cover to keep the dust off your car whilst in your garage, a lightweight cover to take to the shows and occasional use, or a cover that provides excellent weather protection for cars kept outside all year round. Moss have the perfect car cover to fit your car!

Weatherproof outdoor covers

Our range of outdoor weatherproof car covers are manufactured from breathable fabrics. They feature double-stitched seams throughout, with neoprene elastic sewn into the front and rear hems. Fitted with reinforced, scratch-proof grommets for tying down. Car covers must only be used on a dry car.

Note: No car cover is completely waterproof. Simply choose the fabric to suit your requirements: Mosom Plus or Stormproof.

Mosom Plus outdoor cover

Our range of Mosom outdoor weatherproof car covers are manufactured from breathable fabrics with double-stitched seams. The Mosom Plus is rain resistant, yet breathable and features a multi-layer polypropylene fabric which remains soft and pliable in all weather conditions with a soft lining. Fitted with reinforced, scratch-proof grommets for tying down. Recommended for short-term outdoor use. Note: No car cover is completely waterproof. Car covers must only be used on a dry car.

DEMIST YOUR SCREEN

VINYL, DOUBLE DUCK & MOHAIR HOODS

The hoods supplied by Moss are made on jigs matching those used by the factory. The vinyl we use is from the same supplier that originally supplied the factory, these are the closest you will get to an original hood in terms of quality, fit and appearance. Double duck material is a canvas based material which whilst being durable, is prone to fading in direct sunlight. We also make hoods in Mohair, a high quality material that gives a fade free look but can be more difficult to fit as it has less stretch than vinyl based materials. Mohair and double duck hoods have their windows sewn in, this laborious process is the only reliable way of attaching a window to these materials.

All these listings are for black hoods (except for AHA5902MMH), other colours are available. For full details and hood frame/fixings please see the Restoration section. Special requirements may be available to order, please contact your nearest Moss branch.

(Sprite III, Midget II models only).		

MINILITE REPLICA BOLT-ON ALLOY WHEELS

These stunning looking eight spoke, MiniLite replica bolt-on alloy wheels are a timeless classic design, adding a period charm to your classic. They are manufactured using the latest techniques and testing procedures to ensure the highest quality and reliability.

These 13" wheels are sold individually and are supplied with centre caps. Before fitting your tyre choice, please ensure there is adequate clearance between tyres and wheel arches. Do not fit with standard wheel nuts, please contact your nearest Moss branch for advice.

Alloy* 13" x 5" 8 spoke - silverGAC8203X	..£76.50
Alloy* 13" x 5" 8 spoke - anthraciteGAC8213X	..£97.13
Wheel nut (each)TT6320£2.80

Replacement hub caps

Minitor alloy wheel hub caps are available in two different types to suit different size centre holes in the wheels. For wheels with a 59mm centre hole, the cap is made from spun aluminium and available silver painted or polished. For wheels with 61mm centre holes the cap is made from plastic and painted silver.

Hub cap metal - silver 59mm (each)GAC8201XP	..£9.42
Hub cap plastic - silver 61mm (each)GAC8201XPP	..£4.37
MG centre badgeGBC101B£2.00

WHEEL TRIMS

Another popular accessory from days past were wheel embellisher trims. Fitted in seconds, these polished stainless steel trims instantly improve the appearance of steel wheels, without breaking the bank.

Wheel trim 13" (each)GLZ225Z	...£22.70
Wheel trim 13" (set of 4)GAC2254X	...£66.80

TYRE VALVE CAPS

These locking tyre valve cap sets feature the Austin Healey logo and can only be removed with the tools provided. Alternatively the subtle and elegant nickel plated steel valve caps have an embossed MG logo.

Austin Healey valve caps locking215-833NCA
MG logo valve caps nickel plated (each)GAC1054X	...£6.46

Please note: All wheels are sold individually unless otherwise stated, ensure you use the correct wheel nuts for each wheel.

REVOLUTION ALLOY 4 SPOKE

These classic 4 spoke revolution alloy wheels feature black centres with a diamond cut polished rims and look great on a Sprite & Midget. Supplied individually with centre cap. Wheel nuts sold separately.

Revolution alloy wheel 13" x 5"GAC8280X	..£105.00
Replacement centre capGAC8277X	...£8.86
Wheel nut stainless steel bulge (each)TT6320£2.80

WIRE WHEEL TOOLS

The use of a soft-faced hammer is essential if you do not want to damage chrome plated spinners when removing or fitting centre lock wheels. We have a choice of three soft hammers. Extra long spanners are also available, providing much greater leverage for spinners and therefore easier fitting. To help keep your wire wheels looking like new we recommend you use our specialist cleaning kit. We also supply a special lubricant to help keep the splines in good condition.

Copper and hide hammerC27290£25.00
Copper faced hammer11B5166£25.00
Spoke adjusting spannerMM385-800	...£9.50
Short octagonal spannerAHH5839	...£5.90
Long octagonal spannerMM386-120	..£48.50
Long spanner 2-earedMM386-125	..£48.50
Wooden wrench 2-earedAHH5839W	..£25.60

(This unique double ended knock-off wrench, made from plywood, slips over the spinner for easy tightening and removal of spinners. Will not work with centre laced wheels.)

Wire wheel cleaning kitGAC4134X	...£32.50
Spline lubricant copper-eze 50gGGL9205X	...£3.66

(Essential for maintaining the splines and threads of hubs, wheels and spinners).

WIRE WHEEL ESSENTIALS

Creating an air tight seal on a wire wheel can be somewhat difficult, making the use of inner tubes necessary and, to prevent the inner tube chaffing against the spoke nipples, the fitting of a rim band is highly recommended.

Inner tube for 13" x 145/155 tyres452-725	...£12.16
Rim band for 13" wheels452-730	...£10.60

CENTRE LOCK CONVERSION KITS

Convert your conventional steel wheel front and rear hubs to accept splined hubs, enabling the fitting of 'centre lock' alloy or wire wheels. Our kits contain everything you need to convert to centre lock wheels, including full instructions, splined hubs and all the necessary hardware, chrome spinners and a copper hide mallet. Our hub conversion kits do not contain road wheels. Check local regulations for eared spinners.

2-eared spinner conversion kitGAC7017 ...**£285.20**
Octagonal spinner conversion kitGAC7027 ...**£304.40**

CENTRE LOCK SPINNERS

Our centre lock spinners are made from the highest quality materials and are precision engineered to ensure an accurate fit. We have three styles of spinner: octagonal, two or three eared. Two and three eared spinners can be fitted with either a hammer or a spanner, octagonal spinners require a spanner. The basic rule for threads-per-inch (tpi) is, if you have replaced your splined hubs with new ones, you probably need 8 tpi spinners. However, just so you can be sure, here is the original model production (tpi) information. Sprite I-II and Midget I were fitted with 12 tpi hubs, Sprite III, Midget II and future models were all 8 tpi.

Note: Please check local regulations for eared spinners.

WIRE WHEELS

An essential part of a British classic sports car's styling was the fitment of wire wheels. Whether fitted as standard or not, a set of chrome wire wheels will not only enhance the appearance of your car, but also the value. Our wire wheel spokes and nipples are manufactured from stainless steel, with the chrome wire wheel spokes and nipples finished by chroming over the top in keeping with the rest of the wheel. They are available in different specifications; 48, 60 or 72 spokes, and a choice of classic chrome finish, or painted in wheel silver. Depending on how you are intending to use your car, these wheels are available in standard or uprated specification. Before fitting your tyre choice, please ensure there is adequate clearance between the tyres and wheel arches.

Standard 13" x 4" 60 spoke - chromeWWC458 ...**£195.00**
Standard 13" x 4" 60 spoke - paintedWWP458 ...**£140.00**

Note: A few Sprite I models were converted to wire wheels and disc brakes by the Donald Healey Motor Co. We cannot supply any of the components for these vehicles, and the later Lockheed discs and calipers are not directly interchangeable. Wire wheels were only offered as an optional extra from 1963 after the introduction of disc brakes and the 1098cc engine.

CENTRE LOCK ALLOY WHEELS

An alternative to wire wheels, these 8 spoke MiniLite replica alloys are an ideal way to add period sporting style to your classic. The wheels are sold individually and are for fitment to splined hubs only, they can be used in conjunction with our centre lock hub conversion kits. Before fitting your tyre choice, please ensure there is adequate clearance between the tyres and wheel arches.

CENTRE LOCK

SUPERPRO POLYURETHANE BUSHES

With an extensive range of high quality polyurethane bushes and suspension bush kits, SuperPro bushes offer a quieter and longer lasting upgrade to standard rubber bushes.

SuperPro has developed a unique polyurethane formulation exclusively for suspension bushes resulting in an extremely durable product with superior properties to rubber.

- Superior abrasion resistance
- Unaffected by extreme temperature, oils and coolant
- Superior control of noise and vibration

See page A05 for more information

HIGH TORQUE STARTER MOTORS

Especially useful for high compression engines, these powerful and lightweight starter motors are a straight replacement for the original.

The benefit of their huge increase in cranking power means they are less likely to burn out under strain.

WOSP high performance starters have been available in the UK for the last 20 years. They

are built to the highest standards. Most WOSP starter units are based on a modified high power 1.4kW Denso high torque starter motor.

See page A17 for more information

TT6901

WHEEL SPACERS

These spacers allow small adjustments to be made to the offset when fitting alternative wheels. They can also be used if you don't wish to shorten your wheel studs when fitting a wire wheel conversion.

3mm wheel spacer set (pair)TT6901£17.40
6mm wheel spacer set (pair)TT6902£18.95

TYRE TRIMS

A popular accessory in the past were white wall tyres, unfortunately if you can find them now they tend to be made for the US market and of a much harder compound than European tyres. However, we are able to supply a rubber ring which is sandwiched between the wheel rim and the tyre wall, recreating the look of white wall tyres but allowing the use of quality modern tyres.

White wall trim for 13" wheels (set of 4)GLZ225WWX4£55.00

Original series book MGL0260 . £35.90

Inside The Octagon DVD

Inside the Octagon. MG 1921-45, is a fascinating portrait of the pre-war MG Car Company painted by people who were there during MG's magic years. 96 minutes.

Inside the Octagon 2. MG 1946-80, chronicles the MG Car Company from 1946 to 1980. Once World War II was over, the MG Car Company hurried back into car production with the MGTC. Steel was rationed, and England needed an infusion of foreign currency. The MG Car Company turned to the export markets, and a decades-long love affair began between America and the little British sports car. 86 minutes.

Inside the Octagon 211-061 . . £18.40

Inside the Octagon 2 211-062 . . £18.40

RETROMOD SPEAKERS BY RETRO SOUND

The RetroMod range of speakers from RetroSound has been designed to compliment their range of Classic radios and have been manufactured to meet the demands of modern high performance amplifiers.

Dual voice coils (DVC) speakers

This system allows for 2 stereo channels (left & right) to be connected to the same single speaker. This means that originality can be maintained on cars where a single speaker was fitted in the centre of the dash or rear shelf. These speakers are supplied individually without mesh grilles, to fit existing mountings.

6.5" dia 3 way, DVC, no grilles (each)230-505£52.50

5" x 7" 3 way, DVC, no grilles (each)230-545£62.80

6" x 9" 3 way, DVC, no grilles (each)230-510£46.20

Single voice coils (SVC) speakers

The SVC range of speakers is a standard configuration single channel speaker

for normal installations (left & right mounted speakers, such as doors or dash). These speakers are available in a range of sizes and specifications, see our website.

4.5" dia 2 way, 40W max, with grilles (pair)230-535£72.60

5" x 7" 3 way, 60W max, with grilles (pair)230-540£75.00

6" x 9" 3 way, 100W max, with grilles (pair)230-530£67.50

6" x 9" 3 way, 100W max, with grilles (pair)230-531£133.90

RetroMod 8" Subwoofer

The compact design and powerful bass response make this ideal for under seat mounting and numerous other in-car applications. The rigid die cast aluminium chassis and powerful Class D amplifier allows this sub to reproduce low frequencies down to 35Hz.

8" Subwoofer with internal amplifier230-550£170.00

Ordering Information

Notification of prices

Due to the volatility of world markets and currency fluctuations the prices in this catalogue are subject to change. Moss make every attempt to keep prices competitive and stable, however in common with all other suppliers in our industry, we reserve the right to alter these prices without prior notice.

For the latest prices, please visit our website www.moss-europe.co.uk. All prices are per unit (unless otherwise stated) and include (UK) VAT at 20% (where applicable) and are correct at the time of going to print. Postage and packaging is not included. E&OE. Where the price is replaced with NCA this part is Not Currently Available. Please visit our website (moss-europe.co.uk) or call our sales staff for the latest availability information or to enquire if we can offer an alternative part.

Product supersessions

Moss Europe's policy is to detail the most up to date part information in our catalogues. Where possible parts are kept to original specification. However, in some instances we have to supersede to the most viable alternative product to maintain supply and keep cars on the road. Every effort is made to ensure high quality products.

UK ordering

We accept orders by mail, telephone, e-mail, fax and on-line at www.moss-europe.co.uk. If you have the opportunity, we invite you to visit one of our branches. Remember, supplying details of your car, (i.e. engine, commission or Vehicle Identification Number (VIN) LHD or RHD, year of manufacture and any modifications) saves time and helps us to help you. Please inform us of your customer number, as this will speed up the processing of your order.

Overseas ordering

We accept orders by mail, telephone, e-mail, fax and on-line at www.moss-europe.co.uk. If you visit the U.K. please come and visit one of our branches. When ordering, please ensure that you enclose full details of your name, address and customer number, plus details of your car (i.e. engine, commission or Vehicle Identification Number (VIN) LHD or RHD, year of manufacture and any modifications).

Please note: Overseas orders are often subject to local import duties, taxes and Customs clearance, which will need to be paid for at the point of entry. These charges are NOT included in the price of the goods or delivery prices. All relevant Customs forms and documentation needed to ensure the order arrives with the minimum of delay, will be included with your shipment. If you have any special requirements, please contact us to discuss them. Delivery charges are dependent upon the size and weight of the shipment. If a quotation is required prior to placing an order, please contact the export department at your chosen branch and they will be pleased to supply a full quotation.

Parts back-order system

A back-order system is used when a part is not in stock at the time of ordering. If the item is expected to become available within 6 months, then it will be put on back-order, unless the customer instructs us otherwise. When we have the parts in stock, the back-order will be processed automatically and the item will be dispatched to the customer. If the particular part becomes No Longer Available (NLA) or does not become available within 6 months the back-order will be cancelled. If you are unsure when you placed a back-order contact your local branch.

Dispatch & delivery methods

Orders for delivery in the UK may be dispatched by regular post for small/lightweight items, larger items may be dispatched via a courier. Please call us for the best delivery option for your order and the latest delivery prices. For delivery outside the UK we offer the following services.

- **Economy delivery (by road):** 2 to 5 days (approximately).
- **Express delivery (by air):** 1 to 2 days (Guaranteed) - next day service to most countries.
- **For small and low value orders we also use airmail.**

For these services, please ask for prices and the best delivery option when you place your order. Most deliveries (except airmail) are 'trackable', (inc: e-mail updates and internet access for selected carriers). Please remember, all carriage charges are dependent on weight band, volume, destination and delivery time. If a quotation is required prior to placing your order, please contact a member of the sales department. Alternatively, you can arrange your own delivery and dispatch.

Windscreen delivery information

We always suggest that windscreens should be collected from one of our branches to ensure you are able to transport your glass with the utmost of care. However, we understand that this is not always possible.

To minimise the possibility of damage to the windscreen in the shipping process, it is now Moss Europe's policy to ship windscreens packed in a specially designed heavy duty 'Tri-Wall' cardboard box. The price of this box is £35.00 (inc VAT), non-refundable and is not included in the price of the product. The crate's dimensions will also increase shipping costs, particularly in EU countries. The crate dimensions are 150cm x 33cm x 74cm. The maximum volumetric weight is 92kgs. For more information please contact your nearest Moss branch.

Hazardous goods delivery information

At the time of going to print, Moss Europe Ltd conforms to international shipping regulations regarding packaging and transportation of Hazardous Goods by road and sea freight (only). Due to these international shipping regulations and licencing rules all goods deemed as Hazardous are currently available for shipping to the UK and Europe only. If you place an order containing Hazardous goods and your shipping address is not in the UK or Europe, we will not be able to ship this item to you. Please contact your local branch or visit our website moss-europe.co.uk for the latest delivery information of Hazardous goods.

Quotations & payment methods

We will be pleased to provide a full parts quotation detailing price, availability and relevant shipping costs. Payment may be made by cash, personal cheque (to the card guarantee limit), Certified Bank Draft, Sterling Travellers Cheques and credit or debit card including: Mastercard, Visa, Delta. If you intend to make payment by Cheque or Bankers Draft when

using our fast mail-order parts service, please confirm parts availability and carriage charges. We can accept payments using PayPal for website, email and phone orders.

Value added tax (VAT)

Value Added Tax (VAT) at the current rate will be levied on all orders being dispatched to all countries within the European Community. EU countries may be charged at their local VAT rate, please contact us or see website for details. VAT is not charged on goods dispatched to countries outside of the EU. However, such orders are often subject to local import duty, taxes and Customs clearance, which MUST be paid by you at the port of entry. Such charges are not included in the cost of the goods or delivery prices.

Exchange units

We are able to offer a full rebuild service on numerous major components in our product range. We offer this service as an alternative to direct replacement parts, or when a brand new item is no longer available. However, the continuity of this exchange scheme needs the understanding and co-operation of our customers in relation to several important points: It is important to remember that "rebuild" does not mean "brand new". Rebuilding a unit involves stripping, cleaning, inspecting and re-assembling the unit. During this process, parts showing signs of wear will either be completely replaced or suitably renovated. However, it is not always feasible for major sub-components to be replaced with brand new ones, for example, an exchange engine will not have a new block. Due to the nature of certain product lines, some items can only be offered on a "one for one" exchange basis. This effectively means that you must offer us a viable unit before we can release a fully rebuilt item from our stock. In some instances we can only carry out reconditioning of your own unit. Our staff will inform you if this is the case.

All exchange units are subject to a surcharge. This surcharge serves two purposes; firstly, it acts as an incentive for you to return your old unit, and secondly it provides us with financial cover if your returned unit proves unsuitable for exchange purposes.

Whether or not your returned unit is suitable for exchange purposes cannot be ascertained until it is made available to us for inspection. As a general rule, suitable for exchange basically excludes any items that are beyond reasonable repair (e.g. crankcases pierced by a connecting rod) or units irrevocably damaged. We are also unable to accept units unless they are returned in whole, complete form (i.e. differential units which are returned partly stripped with no bearings and all the shims missing are not generally accepted), nor do we accept a "box of bits".

Surcharges will only be refunded once our core department has passed the item as serviceable. Under no circumstances can any exchange unit be shipped overseas until we receive your original unit. We have predetermined prices for our exchange units based on our experience of repair costs for a gearbox, axle or engine. Occasionally, however, the damage to the unit is so great that we will contact you before beginning work on your unit to advise you of any additional cost that may be incurred during the rebuild of the unit. We can return the unit (at your cost) if this proves unacceptable.

'Old unit' returns

Exchange items including reconditioned engines are subject to a surcharge that is refunded when a rebuildable unit (core) is returned. When you receive the rebuilt unit, attached to it will be a Core Return Authorisation Tag. This tag must be removed from the rebuilt unit and attached to the returned core in order to receive credit. Cores must be returned within 90 days of purchase in the original box, carton or engine cradle supplied with the rebuilt unit. Cores must be shipped clean and empty of fluids. Cores must be complete, assembled and rebuildable to receive credit or refund. You must pay all shipping charges for the return of the core and these charges are not refundable.

Warranty

All parts are warranted against defects in materials and workmanship for a period of twelve (12) months from the date of purchase. The warranty does not cover failure resulting from incorrect installation or misuse; failure during any competition, motorsports or track events; failure of any, or caused by any, related component. The warranty does not cover labour charges, nor will a warranty settlement be greater than the cost of the original component. Should you need to make a warranty claim, please contact us immediately at the branch of purchase. We will then advise you as to the best course of action. With all warranty claims a copy of the original purchase invoice must be produced.

Warranty returns

Parts that fail in use may be returned for 12 months from the date of purchase. Returns must be accompanied by the original invoice - no warranty claims will be paid without a copy of the original invoice. Return freight will be reimbursed. Electrical parts returned for warranty will be tested and if found functional, no return credit will be given and the part will be returned. Reimbursement is made by the original payment method. Complete the return form included in each order, pack the items securely and use the shipping return label supplied.

Non-warranty returns

All uninstalled parts, in their original packaging may be returned within 90 days for any reason. A copy of the original invoice or the picking label (which is generally attached to the original packaging) must accompany the return. Return freight is paid by the customer. If the return is due to our error, the return freight will be reimbursed. Parts returned outside of this policy or in non-resalable condition may not be accepted or may be assessed a 15% handling fee. Reimbursement is made by the original payment method. Complete the return form included in each order, pack the items securely and use the shipping return label supplied.

Customer service

We value your custom and wish to ensure that you receive the very best service. Every effort will be made to provide you with Quality Parts and Expertise in a relaxed, helpful and friendly manner. Should you consider the service you receive from us to be unsatisfactory, or you have any problems with the part(s) purchased, please advise a member of the sales team at the originating branch. If the matter is not resolved to your satisfaction, please contact our Customer Services Department and we will do our very best to resolve the issue, either email: customerservices@moss-europe.co.uk or write to: Customer Services, Moss Europe Ltd Unit 16, Hampton Business Park, Bolney Way, Feltham TW13 6DB England.

MGE203	HALOGEN H4 Conversion, (Lucas), LHD1

Production & Development History

Sprite Mkl (AN5 model)

The relationship built up between the British Motor Corporation (BMC) and motor sport celebrity Donald Healey in the 1950's resulted in the creation of the Austin Healey 100 sports car, a vehicle which enjoyed considerable sales success, particularly in the important North American market. A potential market for a smaller 'budget' alternative was soon identified, and this led to an 'informal decision' between BMC's chairman, Leonard Lord, and Healey to develop a small sports car based on Austin parts, mostly centered around the Austin A35 saloon car. The engine, transmission, rear axle and front suspension were all to be used, but steering would come from the Morris Minor and better, hydraulically operated, brakes were needed. MG derived manifolds and twin 1 1/8" carburettors would boost power. The engine was developed by Morris engines, and they later supplied the units since Austin's engine department was at the time overrun with work.

The new car, eventually named the Austin Healey Sprite, was to do away with a separate chassis and bodyshell. Instead, it was designed around a monocoque frame consisting of front and rear bulkheads, joined by 'top hat' sill sections and body stiffeners, all mounted onto a floorpan. Extra rigidity came from the central gearbox tunnel. In many places, the body utilised flat panels and simple formed sections to keep construction costs down to a minimum. The bonnet and front wings hinged upwards as one assembly from the bulkhead, and the upwards curve of the front top edge of the sill panels accentuated this feature. This characteristic sill line was to last until the end of production of the last descendant of the Sprite family tree, the MG Midget 1500, twenty one years later. The first prototype Sprite incorporated external hinges to reduce costs, but expensive pop-up headlamps. By prototype number two, the headlamps had become fixed providing the 'frog-eye' appearance so well known and loved today.

The little Sprite, built in the MG factory in Abingdon, was launched in 1958. It was a hoot to drive, if somewhat cramped inside (another feature which would see out production twenty one years later). It quickly established itself in the motoring world, aided by a low price of £455 (less tax) and a successful motor sport career in the hands of BMC works team drivers, most particularly John Sprinzel.

Sprite MkII and Midget Mkl
(H-AN6 and G-AN1 models)

For 1961 it was decreed that something of a revamp was necessary, and to this end the Austin Healey Sprite MkII was launched, together with a new, slightly more lavishly finished stable mate, the MG Midget. These two models offered a radically altered, more square body profile wrapped around essentially the same under-frame. The rear of the body now had a boot lid for the first time, while at the front out went the charismatic (or ugly, if you prefer) frog-eye look, to be replaced with the conventional set up of separate wings housing the headlamps. Between the wings a narrower, and certainly lighter, bonnet panel gave rather poorer access to the engine bay. The little 948cc engine became more willing, thanks to the fitment of 1 1/4" carburetors and improved cam timing. Steering, suspension and brakes remained largely unaltered.

Sprite MkII 1100 and Midget Mkl 1100
(H-AN7 and G-AN2 models)

The next milestone was the introduction of a 1098cc variant of the trusty BMC 'A' Series engine in 1963. Along with the improved performance, the brakes were duly uprated with front disc brakes appearing for the first time in production on the cars - prior to this, a disc brake conversion kit had been independently marketed by the Healey Motor Company of Warwick. Otherwise virtually unchanged, the new models were known simply as the Sprite MkII 1100 and Midget 1100; they are now often colloquially referred to as the 'Mk 2 1/2' and 'Mk 1 1/2' respectively.

Sprite MkIII and Midget MkII
(H-AN8 and G-AN3 models)

Many aspects of the design were changed at the next revamp, which occurred in 1964. The body of the Sprite MkIII and Midget MkII, largely unchanged in silhouette, received an all new dash layout, fitted carpets in all models, a new windscreen with easier to fit hood attachments, plus wind up windows to replace the sidescreens. These were all improvements inspired by the marketplace (America in particular), which was beginning to lean towards less spartanly equipped, more comfortable cars.

For the same reasons, the beautifully handling but harsh riding rear suspension lost its quarter elliptic springs, gaining instead a more conventional semi-elliptical spring layout which lost a little of the accuracy and sharpness but improved the ride enormously. A benefit not seen at the time, but in the cars' old age now greatly appreciated, is the fact that the new suspension did not impose so much stress on the monocoque body, with the result that split seams, cracks and corrosion around the rear floor and bulkhead were (and are) on the whole much less common on post 1964 cars. In answer to misgivings about the bottom end durability of the engine, larger main bearings were fitted. A larger clutch and strengthened ('Ribbed Case' as opposed to the previous 'Smooth Case') gearbox were also introduced, keeping the model range in line with the other BMC products using that basic type of gearbox, the Morris Minor, Austin A40 and A35 van.

Sprite MkIV and Midget MkIII
(H-AN9 and G-AN4 models)

By 1966, Sprite and Midget performance figures were beginning to look a little feeble when compared with contemporary saloon cars - not an ideal situation for a sports car to be in. Indeed, the immensely popular Mini Cooper 'S', which was also a product of BMC, was taking the limelight and eating into potential sales. In an effort to counter this, a slightly de-tuned version (apparently for reliability's sake) of the 1275cc Cooper 'S' engine was fitted to the Sprite MkIV and Midget MkIII from October 1966.

Along with the improved performance, the new models also benefited from a new, convenient, fold down hood design. It was at this time that cars destined for North America began to seriously deviate in their specification from those built for markets in the rest of the world, due to increasingly stringent safety and emissions regulations there. Also during this period, Midgets bound for Australasia were built there from completely knocked down (CKD) kits supplied from England.

Sprite MkIV and Midget MkIII
(H-AN10/A-AN10 and G-AN5 models)

'Leylandised' versions of the cars arrived for the 1970 model year, in fact some eighteen months after MG, Austin and their parent companies had become part of the massive British Leyland Motor Corporation. The nomenclature - Sprite MkIV and Midget MkIII - remained the same as before, as did the mechanical and sheet metal specifications.

However, the car now had a much more upbeat contemporary appearance, due to a myriad of trim changes both outside and in. Gone was the 1960's style bright-work. A new radiator grille (effectively a blacked out and jazzed up version of the previous Sprite grille) was complemented by slim-line bumpers, fashionably quartered at the rear. Completing the slim-line effect, the sills were also painted satin black, giving the car a sleeker side profile. New spoked steel wheels ('Rostyles') aesthetically matched the car as well as the optional, more traditional, wire wheels, demand for which began to fade. Inside the car, heat welded vinyl abounded, instead of stitched pleat upholstery; this style of interior trim was to remain with the vehicle up to the end of production.

Towards the end of 1971, the Sprite disappeared quietly from the new car showrooms. Sales had slowly slipped away and had latterly been confined to the home market. The last 1022 Sprites were simply badged as 'Austin', since the agreement between Leyland and Healey had lapsed. The Midget MkIII, however, remained comfortably in production, seeing in 1972 with new rear wings with the square topped wheel arches replaced by round ones (not seen on Sprites and Midgets since the 'Frogeye'). As a result it became easier to fit fatter tyres and alloy wheels, which were popular aftermarket accessories at the time. If the urge to fit them was resisted, the car would definitely be sitting on radial ply tyres: they became standard fitment alongside a much needed alternator (which replaced the by then archaic dynamo). As a sop to forthcoming home market safety regulations rocker switches found their way onto the dashboard, replacing the more satisfying but apparently less safe toggle switches. By 1974, Midget sales in mainland Europe had ceased, basically leaving Britain, the USA, Canada and Japan taking the car.

Midget 1500
(G-AN6 model)

As an attempt to rationalise on the build specification, many of the safety and emissions changes necessary for the 1975 North American specification models were also implemented on home market vehicles. These included the well known 'rubber' bumpers (actually plastic), a ride height increase of one inch to meet bumper height regulations, a return to square rear wheel arches and a whole new power train.

As USA emission control equipment had progressively strangled the 1275 engine, the performance maintaining solution was to replace it with the engine out of its closest rival - the Triumph Spitfire. The Spitfire engine had already had its capacity enlarged from 1296 to 1491cc for the same emissions related reasons, while the old BMC 'A' Series unit could not reliably be taken any larger than its current 1275cc. As a result, the entire Triumph engine and gearbox assembly, with only a couple of detail changes, was fitted into the Midget engine bay. This car became known as the Midget 1500, although actually it was still a Midget MkIII officially (and in most respects under the skin was very similar to the outgoing 1275 engined MkIII). While it certainly lacked the keener, sportier edge of the earlier cars, it was undeniably a better cruising vehicle (though sadly it never benefited from the overdrive which was optional on the same gearbox when fitted in a Spitfire).

Sprite and Midget production finally finished in 1979, when the last Midget 1500's rolled off the line. Ironically, amongst the last cars built were five hundred special black models, celebrating fifty years of MG Midget production. In total, 355,888 Sprites and Midgets were built between 1958 and 1979.

The engine number is stamped on a plate secured to the right hand side of the cylinder block, above the dynamo.

Engine Identification

Serial Number Prefix Letter Code

The engine number prefix comprises a series of letters and numbers, presenting in code the cubic capacity and make, the ancillaries fitted, and the type of compression.

1st PREFIX GROUP- cubic capacity, make and type.

1st Prefix Number 9- 950 cc

Prefix Letter C- Austin Healey
CG- Austin Healey & M.G.

2nd PREFIX GROUP- Gearbox and ancillaries

- U- Centre change gearbox
- Da- Close ratio centre change gearbox

Always quote these prefixes with Engine Serial Numbers

Vehicle Identification

Serial Number Prefix Letter Code

The car number prefix comprises a series of letters and numbers, presenting in code the mak, the engine type, the body type, the series, and where applicable, left-hand drive.

1st PREFIX LETTER- Name
C- Austin Healey
CG- Austin Healey & M.G.

3rd PREFIX GROUP- Body Type
N-2-seater Tourer

4th PREFIX- Series of Model

- 1- 1st series (M.G.)
- 2- 2nd series (M.G.)
- 5- 5th series (Austin-Healey)
- 6- 6th series (Austin-Healey)
- 7- 7th series (Austin-Healey)

5th PREFIX- (denotes car is different to standard right-hand drive)
L - Left-hand Drive

Always quote these prefixes with Car Serial Numbers

Chassis No. _____

Body No. _____

Engine No. _____

Model/Year _____

Performance & Tuning

What can I do to make my Sprite/Midget go faster?

There really isn't a simple answer to this question. For instance: 1. Do you want higher speeds on the motorway or do you want more mid-range torque? 2. Do you drive your car fairly hard on a daily basis, or just use it on weekends? 3. Would you like that little bit more power, or do you want maximum BHP? 4. Do you just want the car to be quicker through bends? 5. Then we could ask, have you, or are you going to, upgrade the brakes? 6. Are your suspension and steering bushes/components OK? 7. Will your transmission and drive train handle more power/speed? 8. Is your car standard, or has it been previously overhauled/ uprated?

On the following pages, you will find a range of quality components that will improve engine performance, braking, steering and the handling of your classic and, if you want to make it a real head turner, complete the transformation by fitting a set of wide section alloy wheels. Don't forget, before increasing the power output and speed of any vehicle, you should ensure that your brakes, steering, chassis etc can cope with the modifications, and, a roll bar is a very sensible investment... for all open top sports cars.

A Brief Summary

The Frogeye Sprite I, Sprite II and the Midget I were originally fitted with drum brakes all round as standard equipment and, for the period that the cars were in production they proved to be (just) adequate. When the models were improved and uprated to 1098cc they were fitted with disc brakes to cope with the extra performance. Early models can be modified with later components - many have already benefited from this, however, on this page we will concentrate on modifications to the later type standard setup. The braking system is vital on any car, more so on your classic as driving conditions and speeds make it more difficult on modern roads, so please, ensure that your brakes are always in tip top condition.

High Capacity Fuel Pumps

The standard mechanical fuel pump on the 948cc models may not be able to maintain adequate fuel pressure at higher engine speeds or indeed, the electric pump fitted to the 1098cc models. The range of Facet high pressure electric fuel pumps however, suit all modified applications, the position in the car where the pump is mounted will determine which model is used.

The cylindrical interrupter pumps can be fitted to the front or rear of the car and can pull fuel up to 18 inches from the bottom of the fuel tank.

The cuboid solid state pumps must be mounted close to the tank and below the fuel level the installation instructions must be adhered to. They can pull fuel up to 12" from the bottom of the fuel tank and the filter union must be fitted to the suction side of the pump.

Both types of pump are supplied in negative earth only, they come complete with mounting bobbins and unions, you will have to re-plumb the fuel system around the new pump using a combination of standard pipes and hoses. Fine-tuning of the fuel pressure can be easily achieved by installing a pressure regulator, we can supply either a simple regulator or a filter regulator with a replaceable filter. We have the road competition version with 1/4" and 5/16" connections and the larger competition version with all 3/16" connections. With safety in mind, we also supply an Inertia fuel cut off switch, so that in the event of an accident, fuel delivery is cut-off.

Weber & SU Carburettors & Inlet Manifolds

Increasing the size of carburettors on your engine can give a lot more power if the right combination is chosen. The Frogeye Sprite I was originally fitted with twin H1 SU 1 1/8" carburettors, which were often replaced with HS2 SU 1 1/4" carburettors from the later cars. This relatively simple conversion provides the 948cc engine with a useful power boost, use a complete installation including manifold and linkages.

For those wishing to experiment with the 948cc or 1098cc engine we supply an inlet manifold to suit a single HS4 SU 1 1/2", a single HS6 1 3/4" and one to suit Twin HS2 or HS4 carbs. Many enthusiasts prefer to use the Weber DCOE for competition applications. We offer a range of manifolds and carburettors including one to suit 2 split twin choke carbs - for the serious racer. All our manifolds include gaskets, studs and nuts; the TWM manifold also includes a neat linkage. Weber carbs come with 35mm long ram pipes as standard.

With some SU installations and, when using a Weber carburettor, the inlet manifold no longer supports the closed circuit engine breather system, we supply an alloy catch tank to divert the breathers to, this is essential for all competition cars. Carburettors need to be matched to your engine specification - please contact us for further details.

K&N Filter Ram Pipes For Twin Choke Carbs

Ram pipes, sometimes known as stub stacks are essential to improve air flow into the carburettor. They feature full radiused mouths that help reduce turbulence at the mouth of the carburettor, allowing a much smoother air flow. Ram pipes produce a measurable improvement in performance. The length of the ram pipe slightly changes the engine speed at which power is developed - the shorter the pipe, the higher the speed. These ram pipes can be used on their own, or with a K&N sports air filter, providing there is sufficient clearance from the end of the ram pipe to the case. All ram pipes are sold individually. If unsure as to fitment please contact your local Moss branch.

An Introduction To Moss Special Tuning Front Anti-Roll Bar Handling Kits

The simplest - and most cost effective way to improve your vehicles handling is to fit one of our front anti-roll bar handling kits. All Sprites & Midgets suffer from an inherent handling problem, the standard front suspension design allows body roll which induces understeer. This is the tendency of the car to go straight on when steered into a corner because the slip angle of the front tyres is less than that of the rear tyres. With its rear wheel drive design, the Spridget is more comfortable and stable when this understeer has been reduced towards what is known as Oversteer. This is the tendency of the car to turn into the corner because the slip angle of the front tyres has become greater than the rears.

Moss Special Tuning anti-roll bar handling kits have been very carefully produced as complete packages to suit each model - research has shown that the requirements for each model are different. Because the anti-roll bar provides the key to improved handling, we focused our research and testing on all the production anti-roll bars, as well as testing many experimental units. From this work, the correct components were selected to provide excellent roadholding while preserving the ride quality - without the need for other modifications. Please Note: When carrying out any suspension modifications, it is vital to ensure that all other components are in good working order to handle the increased cornering speeds and, to maximize the benefit of any modification.

Moss Front Anti-Roll Bar Handling Kits

For semi-elliptic rear springs. The standard front suspension design allows body roll that induces instability. Fortunately this situation can be easily rectified by fitting one of our well proven handling kits. The inherent problem with the handling of these models is roll-induced understeer

making high speed driving somewhat difficult.

Our handling kits are designed to reduce body roll, whilst retaining good ride quality. Each kit includes a stronger front anti-roll bar with uprated centre mountings, plus, uprated rear shackle bushes to reduce rear end steering caused by lateral spring movement.

An Introduction To The Front Anti-Roll Bar

As mentioned earlier, the handling is mainly controlled by the front anti-roll bar. For those owners who wish greater control of their vehicles, here we list the full range of bars together with the basic recommendations. Increasing the diameter of the bar will progressively reduce body roll and understeer tendencies. Too strong a bar will allow understeer to develop and will increase the harshness experienced on bumpy roads -making the car twitchy. Larger wheels and tyres may allow a stronger bar to be used due to the increase in unsprung weight.

The amount of load transferred by the bar is proportional to the square of the bars diameter. Competition cars will usually benefit from the fast road bar when using Slick or Competition tyres, they are usually much lighter than standard, so may benefit from a smaller bar which can be selected from the table.

Front Anti-Roll Bars And Front Suspension Conversions

An uprated front anti-roll bar will help you get the full cornering benefit from your classic, even if you haven't modified the suspension, but, if you are considering increasing the engine power and performance, it is a very wise investment.

Front Suspension

As well as fitting a anti-roll bar handling kit, many owners want to further modify their car for fast road or even competition use. On Sprite & Midget sports cars the front suspension should be stiff and the rear pliable; this reduces body roll at the front, lessening the chance of 'lifting' the rear inner wheel when cornering hard. Please Note: When carrying out any suspension modifications, it is vital to ensure that all other components are in good working order to handle the increased cornering speeds and, to maximize the benefit of any modification.

Front Suspension Bushes

Handling improvements can be obtained from the better location of the wishbone arms, and other areas of the suspension that are fitted with standard (soft type) bushes as originally fitted. These can be replaced by using a harder grade of rubber, polyurethane, or for competition, nylatron. Nylatron bushes are not recommended for road use unless you are willing to accept an increase road noise and a harsher ride, they must also be fitted carefully to ensure the correct working clearance is obtained - and they must be inspected on a regular basis. Please contact your local Moss branch for fitting details.

Nylatron has been used on competition cars for many years, it is hard and unforgiving, whereas the modern polyurethane bush has a softer edge and is more easily installed. Road cars can benefit greatly from polyurethane bushes without the harsh ride associated with nylatron. Nylatron's strength does mean that we are able to offer the top trunnion bush with an offset drilled centre hole, this allows the suspension camber to be adjusted. The fitting of nylatron bushes is best left to someone with engineering experience.

IMPORTANT Descriptions & Dimensions

As we have no control over installations/modifications (whether previous or current), it is the sole responsibility of the user to ensure safe and correct fitment, tolerances and clearances. Manufacturers/suppliers descriptions and dimensions are given in good faith at the time of publication. Errors and Omissions Excepted.

Uprated Front Lever Shock Absorbers

One of the most popular modifications to the Sprite and Midget range has been the fitting of uprated shock absorbers, especially to the front where they have great effect controlling the road undulations. It is essential for good roadholding that the shock absorbers are in good condition, you might note that they are also the top wishbone, so wear here can really upset your handling. We offer a choice of new units with a competition valve, reconditioned exchange units or, we can supply a new competition valve to uprate your own units.

The recon' units are a budget solution and due to the age of the components will be unlikely to last as long as new ones. We also stock shock absorber fluids for those who wish to tinker with damping rates. Please note that an exchange shock absorber will be subject to a surcharge, which will be refunded when the old unit is returned to us. Note: Units sold individually, but should only be fitted in axle pairs.

Front Road Springs

The Sprite and Midget range will benefit from an increase in front spring rate and, from lowering. The Frogeye Sprite is a little lighter at the front and will sit slightly higher on the springs listed below than the other models.

We can supply an uprated spring for fast road use at approximately standard ride height, an uprated rally

spring with an increase in ride height by 24mm and, a uprated road/competition spring with a reduction in ride height of 20mm. These measurements are based on the same car weight and can vary from car to car, especially on competition vehicles. The ride height can be adjusted up in increments of 5mm using 3mm spacer rings, or lowered using the lowering spacer set which can lower the car 12mm.

Rear Leaf Spring

¼ Elliptic, Sprite I, II & Midget I

These models are fitted with ¼ elliptic rear springs - quite unlike the semi-elliptic units on the later disc brake cars. We supply heavy duty replacement springs as the original factory units are no longer available.

Semi-Elliptic, Sprite III & Midget II

These models were fitted with the semi-elliptic full length rear spring suspension, we can offer 1" lowered springs to reduce the tendency for the car to oversteer and to help level the car when lowered front springs have been fitted. For the competition enthusiast we can supply a lowered and reversed rear spring dropping the car 2" although these cars are usually lighter than standard, reducing this effect. All new rear springs are supplied with a new standard front eye bush.

A much tighter feel for the handling can be achieved by replacing the standard suspension bushes with either polyurethane or nylatron. Nylatron has been used on competition cars for many years, it is hard and unforgiving, whereas the modern polyurethane bush has a softer edge and is more easily installed.

Road cars can benefit greatly from polyurethane bushes without the harsh ride associated with nylatron. The fitting of nylatron bushes is best left to someone with engineering experience.

An Introduction To Anti-Tramp Bars

The use of anti tramp bars is highly recommended for cars which have more than standard power available. They are fitted between the rear spring front eye bushes and the centre spring mountings on the axle by special brackets which are supplied as part of the conversion. When power is applied suddenly, usually from a standing start, the rear leaf springs tend to wind up into an 'S' shape, and then revert to normal in a series of hops, referred to as tramping. Anti tramp bars restrict flexing of the front half of the leaf spring when under extreme loadings, by allowing only vertical movement of the axle; thus deprived of its natural twisting motion the axle can no longer tramp.

Uprated Half Shafts And Quaife Limited Slip Differential

The weak spot on the back axle is the half shaft, we can supply uprated EN40B nitrided steel half shafts, so broken shafts should be a thing of the past. There is a tendency for the inside rear wheel to spin during hard cornering or when pulling away from a greasy junction, so we supply the Quaife limited slip torque-sensing differential to control this. The smooth action of this unit spreads the torque between the rear wheels; optimising traction at all times. The unit fits in place of the standard differential cage and gears, the crown wheel bolts to it, then the unit must be very correctly assembled into the housing, this job is best left to a professional.

Crankshaft Oil Seal Conversion Kit

All Modern engines use lip type crankshaft oil seals and generally have little trouble emanating from this area. Older engines often used scroll or oil thrower type seals which seem to be both difficult to fit and unpredictable in life span. There is now a range of lip seal conversions for these older engines, which are quite easy to fit and have reasonably long lives. If they ever fail in the future they are cheap and easy to replace. Fitting varies according to the engine type so instructions for each are included. All conversion kits require the scroll to be ground off the original crankshaft to a precise spigot size and there are no other special requirements. These really are one of those fit and forget conversions.

Flywheel & Clutch

The same flywheel was used for all 948cc models up to the arrival of the 1098cc engine, it changed again when the 1098cc engine went to 2" main bearings. The flywheels cannot be interchanged. The flywheel can be lightened easily by 3lbs or more, this work is best left to an experienced engineer. The four bolt flywheel can escape on high revving engines, so it is a good idea to have 2 dowels fitted, this will aid location too. With the original smooth case gearbox the 948cc engine coil spring clutch cover can easily be replaced with a diaphragm cover to give greater clamping pressure and improved reliability. For harder use the larger 1275cc clutch cover can be fitted to the flywheel if the lugs are ground back to clear the bell housing and the flywheel holes re-pitched for the cover. It will still be necessary to grind some material off the inside of the bell housing to clear the cover; this is best done with a trial fitting.

The front cover and fork from the ribbed box must be fitted to the early box as the clutch operating fork has a different pivot point. It is not a direct swap but will fit with a little light engineering, the 1275cc release bearing can then be used. If the ribbed case gearbox has been used you can use either of the above clutches and their operating mechanisms. We do not have any alternative clutch applications for the 1098cc engine although your best bet would be to utilise and modify components from the 1275cc clutch.

We have listed the three release bearings to help you select the correct one if fitting an unusual clutch combination. It would be worth checking the geometry of the installation to ensure smooth clutch action, it is not uncommon for the operating arm to need tweaking a little to achieve concentricity. You should note that the 1275cc slave cylinder has a 1" bore diameter, not the earlier 7/8", a different hydraulic connection and a 69mm push rod length.

Gearbox Upgrades

Gears for the 948cc smooth case gearbox are no longer available, the alternative is to machine the 948cc casing to utilise the internals from the 1098cc Morris Minor 1000 gearbox, this gives improved synchromesh on 2nd, 3rd and top gears. The individual internal components from the Morris Minor are not interchangeable with the Spridget parts. The gears for the 1098cc Spridget ribbed gearbox are also no longer available and it is common to replace the gearbox with the later 1275cc ribbed gearbox.

This will at least allow you to use the SCCR (straight cut/close ratio) gears for racing. Careful assembly and maintenance will keep this reliable. The SCCR set does not include 1st or reverse gear, as it works with the originals, we would recommend fitting a new 1st gear ring and reverse gear along with the set. It will require that you have a 1275cc box to work with, the components that you will require for this will be in our 1275/1500 Midget catalogue.

Performance Camshafts

All the Kent camshaft applications/part numbers below with the suffix 'P' are for the original pin drive oil pump/camshaft as used on 948cc and 1098cc models. If you have changed your camshaft and oil pump to either star drive or metro slot, use the suffix 'S' or 'M' on the part number. All Piper cams with the suffix 'E' are star drive unless otherwise stated.

To assist in selecting a suitable camshaft we have prepared a table showing their various characteristics, these will change from engine to engine and with other modifications such as carburettor or valve size. A scatter profile is where the cam timing on No.2 and 3 engine cylinders has been altered slightly to combat the poor scavenging of the siamese port design. This will benefit both the tickover and high end performance. The effect of a larger engine is to lower the camshaft's power range slightly, the power range below is applicable to 948cc engines. 1098cc engines will tend to use one range 'hotter' than below for the same effect.

Care must be taken to ensure that installation is carried out correctly and that components all work together or you will not get the expected power output or reliability. It is essential that the new cam is fitted with new followers as they mate with the lobe that they run on and should never be used on another lobe.

Lightened and tufrided followers wear more slowly and put less load on high lift cam lobes; they are also manufactured with a drainage hole. Another essential is the special lubricant that must be used with all new cams, it provides vital lubrication during initial starting and protects your cam from extreme wear in its first minute of use. (S/T = Special Tuning). Don't forget the cam timing degree disc, TT2929, you will need this to set your cam timing, or, camshaft assembly lubricant.

Camshafts Drives

The correct cam timing is very important when fitting a high performance cam. There are several ways to ensure that the timing is as it should be. Offset keys allow adjustment of the standard cam gear and come either singly to size or in a set of three assorted sizes.

It would be preferable to convert to duplex gears rather than the standard single row as the duplex chain is less prone to stretching. The cam timing can also be easily adjusted using a duplex conversion with vernier cam gear, the outer gear ring is attached to the inner boss through slots with screws.

The timing can easily be adjusted and the screws then tightened up to lock the gear in position, we would recommend working around these again individually, applying a thread locking compound.

Duplex just means it features a double row timing chain which is much stronger and therefore more reliable than the single row chain system fitted as standard. Kit includes a timing disc which allows precise fitment of camshaft. Also available is a set of improved cam followers.

Modified Cylinder Heads

The A series engine responds well to improvements to the cylinder head, both in porting and gas flow. It is possible to interchange heads from other models but check carefully the combustion chamber capacity for the compression ratio and the clearance between the fully open valves and the block. The best head to use is the 12G940 casting with an 11 stud configuration, this is from the 1275cc Mini Cooper S. Engine reliability will benefit from fitting the extra two studs although the block will need drilling and tapping to suit.

The head gasket will need changing too for the extra studs, the traditional competition gasket needs soaking in water before use or we can highly recommend the Metro Turbo head gasket for all applications. When swapping components between models care should be taken to ensure compatibility. Fuel is predominantly lead free now and although you can use octane boosting additives all our heads are modified for lead free fuel. We would suggest that you keep compressions down to 9.5:1 for road use.

We supply Stage 2 and Stage 3 heads for road use. They both have fully worked ports, reshaped chambers, new guides and uprated valve springs. Valves are reprofiled on both heads, but Stage 3 units have larger inlet valves. The shortage of original heads will require that the work is carried out on your own unit. We will also need to know details of your engine cyl bore size and piston type, to enable us to arrive at the correct compression ratio when working on your own unit.

We can supply a new alloy replacement head, this is based on 1275cc spec' and comes bare, or with 33.3mm inlet valves and 29.4mm exhaust valves, the chamber is 23cc and the head has a thick deck to allow room for skimming. Heads can be modified to a higher specification, please contact your local Moss branch for full details.

Gas Flowed Cylinder Heads

Note: For original standard and uprated valves/valve springs/guides and technical notes please see pages 18-19 (cylinder head) in the Restoration section. The A Series cylinder head, having siamese ports, produces a poor breathing engine; this can be improved by gas flowing the cylinder head. To achieve further improvements larger gas flowed valves are also installed.

All of the heads listed are only available on exchange for an old serviceable unit. For more information please contact your nearest Moss branch.

Stage 2 Heads

Modifications include more detailed gas flowing of the ports and chambers, standard size reshaped valves, re-cut valve seats, new guides and double valve springs.

Stage 3 Heads

These heads are for tuned engines requiring flow capability to match the relevant camshaft and carburettor modifications. Recommended for all fast road engines, the inlet valve size is increased along with the ports and chambers to produce the special flow profile. All heads are supplied with new valves, road uprated valve springs and new valve guides.

Stage 4 Heads

This stage offers the ultimate in flow capacity for road/competition use where the full potential of the modifications can be realised. The specification is as per stage 3, plus larger exhaust valves and further extensive shaping of the ports and chambers. The compression ratio will depend on the customer's use of the engine; for road use up to 9.75:1 is recommended, for fast road and sprint use up to 10.5:1, whilst for racing up to 11.5:1 may be required. The preferred ratio should be specified at the time of ordering so that the correct compatibility with the engine build can be ensured.

Uprated Rocker Gear, Cam Followers And Timing Degree Disc

All cars can benefit from a replacement tufttrided rocker shaft, they will resist wear and breakage especially when using high revs. The friction and the rocker side loads normally associated with the standard rocker gear can be reduced and the location made more positive, by fitting the three piece steel spacer set instead of the standard shaft springs.

Higher ratio rocker assemblies in steel are available taking the ratio from 1.245:1 to 1.5:1 and also the alloy roller tipped versions. The roller rocker version increases the ratio to 1.5:1 and is also available at 1.3 and 1.7 to special order. The roller tips reduce the side loads on the valve stems and associated wear. The higher ratio is ideal for increasing the valve lift and improving the torque and is best combined with a suitable camshaft as listed in our camshaft table.

Uprated Valves, Springs And Pushrods

You will probably find yourself working on a 1275cc head to fit to your early engine; we have listed

some components that will interest you for use with the 1275cc head. As we mentioned before, care must be taken when interchanging components, the 1275cc push rod is approximately 9mm longer than the earlier versions and the valves are 3mm longer with different collets and caps.

We can supply carbon fibre push rods for race applications but, extreme care must be taken when installing them. Please call your local Moss branch for details. Uprated valve springs will work well with all road camshafts with standard ratio rockers and are good to around 7000rpm.

Competition valve springs are good with either high ratio rocker gear or race camshafts and, depending on specification, are good to 8000rpm. They must be used with our alloy caps and be shimmed to the correct fitted height. Alloy caps and 1275cc type valves and collets can be used with either set of springs, their light-weight will help minimise wear on the valve gear and cam.

The selection of valve size will depend upon the torque or high revs required, this must be considered along with the camshaft and rocker gear selected. In general, larger valves are not required unless high revs are needed. Larger inlet valves with suitable port mods can improve mid-range and upwards, power output by up to 8bhp.

All these valves improve the flow to increase performance and are made in 214N stainless steel for high strength and reliability. Bronze valve guides will help reduce wear and will resist sticking on high performance engines.

Performance Information

This section will give you further information on tuning theories and rules for the Sprite & Midget.

Suspension Characteristics

Modifications to the suspension are aimed at improving handling and road holding. The primary way of changing these characteristics is to alter the car's tendency to over steer or under steer. The latter two terms are defined thus:

Under Steer

The car still tends towards the straight ahead, even after the front wheels have been turned into a bend.

Over Steer

When the car is steered into a bend, the rear end of the car will increase the turn in angle by tending towards the outside of the bend. There are many reasons for these two situations and hopefully as many ways of changing them. The aim, certainly on a road car, is to produce a 'neutral' chassis, which is easy to drive quickly and safely.

Front Coil Springs

One car can vary considerably from the next; it may be found that on some cars the road springs do not reduce the height, because the originals have sagged to a lower ride height through old age or damage. For this reason, quoting '1" lowered' springs has no real meaning unless the original factory specified ride height of the car is known.

The relationship between the new springs fitted length and the resulting ride height is a ratio of approximately 5:8; i.e. if the springs fitted length is 5 units shorter, the reduction in ride height will be 8 units, the amount increasing because the lower wishbones do not sit horizontally on the car.

Nylatron Bushes

Nylatron, a compound of nylon and molybdenum disulphide, is an extra tough material designed for high load conditions with low rotational movement. Its main advantage is that, due to the molybdenum disulphide, it requires very little lubrication. The use of a copper based grease on the pivot pin inside the bush is all that is usually required.

What Problems Might Nylatron Cause?

As it is a great deal harder than standard rubber bushes, road noise and any harsh surface vibrations will be transmitted more readily into the car. A nylatron bush will alter the way a joint works; a rubber bush, gripping both the pivot within it and the sleeve around it, will allow its outer surface to twist over itself. The nylatron equivalent, having no obvious elasticity must be given clearance between itself and the pivot to allow free rotation.

The amount of clearance has to be judged while fitting the component; it must not be excessive, or the benefits of the bush will be lost. As an example, nylatron rear spring shackle bushes should allow an otherwise unattached spring to swing easily under its own weight. In an instance when a pivot nut would normally be nipped up to hold a rubber bush tightly, but now gently secures a nylatron item instead, it is suggested that an extra lock nut may be required.

As the bushes are primarily designed for competition use, they may require slightly modifying to suit the customer's own pivot pin or bolt. The bushes supplied by Moss Special Tuning are injection

moulded for consistent quality; this therefore means that 'adapt to fit' operations should be kept to a minimum, but may still be occasionally needed to obtain the best results. Nylatron bushes should be checked over regularly and re-tensioned or replaced as necessary.

Wheels And Tyres

Even different makes of tyre, let alone different widths or profiles (aspect ratios), tend to affect road holding of the car much more than most owners realise; just by changing to another brand the handling of the car can be transformed.

13" Diameter

The standard car used 4" rims; for fast road use 5" is ideal, though wheels as large as 6" wide can be fitted, having carried out minor body modifications. When used purely for racing, the choice of width falls much more to the regulations of the class competed in.

Brakes

Remember, some, but not all brake pads and linings may still be made from asbestos; for personal safety do not use a brush or air line to remove brake dust, but instead use a vacuum cleaner or a damp cloth together with a can of brake cleaner. Make sure the dust or cloths are disposed of properly.

Brake Discs

Discs need bedding-in on low speed gentle braking for about 10 miles; gradually raise the speeds, but maintain the gentle braking application. Then make 2 to 3 heavy braking applications, which should complete the bedding in.

Engine

Here we shown some formulae which are useful when modifying an engine:

Swept Volume = $\pi r^2 h = 3.142 \times (\frac{1}{2} \text{ bore diameter})^2 \times \text{stroke}$

Cubic Capacity = swept volume x no. of cylinders

Compression Ratio = $\frac{\text{swept volume} + \text{chamber volume}}{\text{chamber volume}}$

Where chamber volume includes gasket, piston (if dished) and amount of deck height as well. All dimensions should be in centimetres.

Is Your Engine Standard?

Before you start installing modified engine parts please take a few moments and check to see if your engine unit is standard. It may be that the cylinder head has been skimmed and/or the cylinder block has been bored-out.

Cylinder Block

Cylinder block modifications nearly all take the form of normal engineering practices, the only exception being the work required to fit a longer throw crankshaft. Steel strengthening straps for the main bearings can be very worthwhile in an engine rebuild if it is envisaged that the unit will be used to the limit. It is suggested that all main studs and bolt threads should be bottom tapped; for the head studs, the top threads should be slightly countersunk to ensure that the head is secured flat to the block and all loads are spread through the block.

If an increase in the engine's capacity is sought, ensure that all of the new components are compatible with each other and specifically designed for the new capacity; this is especially important when matching the cylinder head and pistons.

Carbon Fibre Push Rods

When installing these push rods, it is of the utmost importance to ensure that the rods do not rub or touch the side of the cylinder head or block during the engine's rotation. Due to the production variations in the block castings, it is recommended that all the push rod apertures are elongated by at least one millimetre at right angles to the rocker shaft.

Then, with the camshaft and rocker gear in position, ensure that full clearance has been obtained. It is advised that all the push rods are painted up to the end caps in a light colour, then installed dry with zero tappet clearances. Rotate the engine by hand a number of times, without the spark plugs fitted, then check the push rods individually for abrasions in the paint. If any are marked, ensure that the offending block material is removed, then recheck.

Having cleaned the paint from the rods, they are then ready for final assembly. It is possible to go through the process described above and only open up those apertures that need modifying, but it is safer to assume that all holes will need to be opened out. Also remember if a camshaft profile is subsequently changed or high lift rockers are installed, the clearance checking will have to be repeated.

1098cc Cylinder Head

The compression ratio is best kept to 9.5:1 for fast road use; a slightly lower ratio may be necessary if 99 octane fuel is not available. If using larger exhaust valves, it is recommended that the exhaust guides are slightly offset to reduce the heat in the hot spot area between the valve seats. For road use, larger inlet valves will give better performance and a wider power range than that of the stage 2 head with standard valves. Bronze alloy valve guides are always recommended for improved reliability.

Valve spring rates depend on the camshaft and rocker ratio being used; for a road car using up to 1.5:1 ratio rockers, uprated springs are normally more than adequate. Competition springs are only required if higher lifts are used. If the copper AHT188 head gasket is used, remember that it should be soaked in water before fitting. The joint surfaces of both head and block must be checked for distortion and finely surface ground if necessary, using engineer's marking blue for final checking.

The tops of the cylinder head stud threaded holes in the block may be slightly countersunk, helping the head to pull down around the studs more effectively. Improved flanged head nuts (53K1193B) help further by guaranteeing the clamping pressure on the head. Finally, competition head studs may be fitted if an increase in the torque setting is required; these studs may be tightened to 55lbs ft.

Camshafts

There are three types of oil pump drive and subsequently three oil pumps for the A Series engines:

Pin. Using a small slot in the rear of the cam; fitted originally to 948/1098cc engines.
Star. Fitted in all 1275cc Sprite and Midget engines as standard.

Metro. Using a slot drive cam; never originally fitted to Sprites or Midgets.

The standard oil pump is perfectly suitable, although for late 1098 models the late Metro Turbo unit (CAM6614) has a substantially increased capacity and can be fitted if the camshaft is changed at the same time.

The range of profiles available for this engine is seemingly infinite and comes from many suppliers around the world. Moss has chosen several, which have proved to be competitive in terms of both performance and reliability, with profile working ranges producing a driveable car in road use, which is where most uprated engines will operate. For full race applications, special profiles are made on blank camshafts which offer much better power and range than re-profiled units.

Rocker Gear

The easy way of increasing performance on the 1098cc engine, once the head has been flowed, is to use high lift rocker gear which may be fitted easily as a bolt-on component. There are two versions, both at a ratio of 1.5:1, either with or without needle roller bearings, the former being recommended more for competition purposes. High lift rockers maintain the opening and closing details of the camshaft profile, but will open the valve further to improve breathing; this is especially effective when used with a flowed head and improved carburation.

Solid spacers ensure accurate alignment of the rocker arms and valves, while strengthened rocker pedestals are essential if a standard rocker shaft is used with stronger valve springs.

Timing Chain

The standard chain may either be single or duplex; whenever a performance camshaft is fitted, a duplex chain must be used, preferably with a vernier adjustable cam gear, which makes correct and accurate installation of a performance camshaft much easier.

The camshaft timing belt conversion kit will make the engine much quieter as well as reducing the power loss suffered when using a duplex chain. A timing belt must be checked religiously every 10,000 miles and replaced at 20,000 miles.

And Finally...

As well as lightened flywheels and other products, we also offer a full balancing service for crankshafts, con rods and flywheels, and tufriding for crankshafts. Please contact your nearest branch for details.

Note: These pages list only the major items in each area, such as body work, electrical and brake components. In many cases minor fittings, clamps and linkages etc, are not shown.

23	BH606261	£1.00	BOLT, (3/8")	2	
24	2A5552	NCA	CROSSMEMBER, (gearbox)	1	
25	2A5420	£3.50	MOUNTING, (gearbox steady)	1	

Reconditioned Exchange Engines

All our 'lead free' full engines are rebuilt by a major engine re-conditioner.

Due to the scarcity of suitable/reconditionable engine units for some 948 & 1098 models, we offer a full reconditioning service for your own unit. This is particularly useful if you wish to retain originality. For some 1098 models we can supply reconditioned engines from stock on a exchange basis.

For all models we advise you to verify the exact type of engine fitted by checking engine number to chassis number.

Old units returned under the exchange scheme should be drained of oil and be externally clean with no irreparable damage (like a hole in the block). If you are unsure please call to determine exactly what should be returned as an old unit. For example, you will have to remove the water pump, inlet & exhaust manifolds, distributor, starter motor, sparking plugs, oil filter, flywheel, rear engine mounting plate, front crankshaft pulley, (harmonic damper where fitted), thermostat and housing from your old engine.

Moss Reconditioned Engine Assemblies include a fully built 'lead free' cylinder head, re-bored engine block, pistons, connecting rods, re-ground crankshaft and camshaft, new bearings, front engine plate, timing chain and gears, rocker cover, timing cover, cam followers, rear seal housing, oil pump, sump, and gaskets. They do not include the oil filter, oil filter housing, back plate, engine or alternator mounting brackets, dipstick, front pulley or flywheel.

'Old Exchange Engine Units' MUST be returned in a 'Re-conditionable' state which means, Complete, Assembled, Clean and Fully Drained of Oil & Water. All Slave components MUST BE correctly attached. A Deposit/Surcharge is applied when an exchange reconditioned engine unit is sold. This is refundable once the 'Old Unit' has been returned, stripped and inspected by us.

If the worn unit fails to comply with the conditions, or, if the components are damaged, unrepairable or missing due to reasons other than 'Fair Wear & Tear', a charge may be deducted from the deposit.

Engine Units & Cylinder Block Components

Note: Please see the Accessories section for full details of engine units and cylinder block components.

	8G2332/30	£36.20	BEARING SET, main, 0.030"	1	
	8G2332/40	£17.35	BEARING SET, main, 0.040"	1	
			(Standard diameter of Main-end is 1.7505").		
43	BHM1292	£12.05	THRUST WASHER SET, (standard)	1	
	BHM1292/3	£14.95	THRUST WASHER SET, +0.003"	1	(Standard thrust washer thickness is 0.092").

10CC Engines Only, (Late)

30	8G150E	£1683.00	ENGINE, (full), (lead free), reconditioned	1	customers own unit
31	BHM1211	£22.90	BEARING SET, camshaft, (3 bearings)	1	
32	AGE148E	£87.00	CAMSHAFT, exchange	1	
39	12G429E	£287.70	CRANKSHAFT, reground/exchange	1	with bearings & thrust washers
42	8G2391	£19.00	BEARING SET, main, (standard)	1	
	8G2391/10	£19.00	BEARING SET, main, 0.010"	1	
	8G2391/20	£19.00	BEARING SET, main, 0.020"	1	
	8G2391/30	£19.00	BEARING SET, main, 0.030"	1	
	8G2391/40	£19.00	BEARING SET, main, 0.040"	1	(Standard diameter of Main-end is 2.00").
	LNZ607	£1.85	LOCK NUT, (main bearing)	6	
43	BHM1293	£12.00	THRUST WASHER SET, (standard)	1	(Standard thrust washer thickness is 0.0925").
	BHM1293/5	£12.00	THRUST WASHER SET, +0.003"	1	

All 1098cc Engine Ranges

33	8G2441	£159.70	PISTON SET, (c/w rings), (standard)	1	8.9:1 compression (set inc 4 pistons)
	8G2441/20	£159.70	PISTON SET, (c/w rings), 0.020"	1	
	8G2441/30	£159.70	PISTON SET, (c/w rings), 0.030"	1	

	8G2441/40	£159.70	PISTON SET, (c/w rings), 0.040"	1	
	8G2441/60	£159.70	PISTON SET, (c/w rings), 0.060"	1	
34	BHM1162	£56.00	RING SET, (car set), (standard)**	1	(Standard bore size is 2.542").
	BHM1162/20	£56.00	RING SET, (car set), 0.020***	1	
	BHM1162/30	£56.00	RING SET, (car set), 0.030***	1	
	BHM1162/40	£56.00	RING SET, (car set), 0.040***	1	
	BHM1162/60	£56.00	RING SET, (car set), 0.060***	1	

**Note: When fitting the rings to the 5 ring 1098cc pistons, take care when fitting the bottom (1 piece) oil control ring. You will notice that there is a square peg in the bottom locating channel, and it is important that this peg is lined up with the gap in the oil ring. If the ring is not positioned correctly it will break when compressing the rings prior to fitment.

35	12G126	£63.90	CON ROD, (cylinders 1 & 3)	2	all 948cc engines 10CG engines, early 10CC engines, late

			(Reconditioned/exchange with valves & springs).		
6	AEA306	£22.00	HOUSING, thermostat	1	
7	53K530	£1.10	STUD, (5/16"), thermostat housing	3	
9CG Engines Only, (Late)					
2	12A186	£1.64	GUIDE, inlet valve	4	
3	AEA574	£5.50	INLET VALVE, (29.4mm)	4	
4	2A639	NCA	SEAT INSERT, inlet valve, (standard)	4	
	AEA762	£6.35	SEAT INSERT, inlet valve, oversize	4	(1.58mm)
5	28G193LF	£307.50	CYLINDER HEAD, unleaded	1	
			(Reconditioned/exchange with valves & springs).		
6	AEA306	£22.00	HOUSING, thermostat	1	
7	53K530	£1.10	STUD, (5/16"), thermostat housing	3	
8	AEA401	£0.98	VALVE SPRING, inner	8	
	AEA401K	£17.00	VALVE SPRING SET	1	includes 8 inner springs
9	AEA403	£1.60	COLLAR, valve spring, lower	8	
10	ADP210	£6.24	PLUG, blanking	1	
11	1B3664	£0.29	WASHER, blanking	1	

1098cc Models

10CG Engines Only, (Early)					
2	12A186	£1.64	GUIDE, valve	4	
3	AEA574	£5.50	INLET VALVE, (29.4mm)	4	
4	159904	£11.60	SEAT INSERT, inlet valve, (standard)	4	to eng no. 10CGDAH 14877
5	28G191LF	£359.00	CYLINDER HEAD, unleaded	1	
			(Reconditioned/exchange with valves & springs).		
10CG Engines (Late) & 10CC Engines					
3	12G296	£4.21	INLET VALVE, (31mm)	4	
4	12G721	NCA	SEAT INSERT, inlet valve, (standard)	4	from engine
5	28G222LF	£348.50	CYLINDER HEAD, unleaded	1	no. 10CGDAH 1487878
			(Reconditioned/exchange with valves & springs).		

All 10CG & 10CC Engines

2	12A186	£1.64	GUIDE, valve	4	
6	12G243	£17.00	HOUSING, thermostat	1	
7	CHS2515	£1.00	STUD, thermostat housing, (5/16")	3	
8	AEA401	£0.98	VALVE SPRING, inner	8	
	AEA401K	£17.00	VALVE SPRING SET	1	includes 8 inner springs
9	AEA403	£1.60	COLLAR, valve spring, lower	8	
10	ADP210	£6.24	PLUG, blanking	1	
11	1B3664	£0.29	WASHER, blanking	1	

All 948cc & 1098cc Models

6	AEA306	£22.00	HOUSING, thermostat	1	948cc engines
	12G243	£17.00	HOUSING, thermostat	1	1098cc engines
48	GTG101	£0.29	GASKET, thermostat housing, cork	1	standard material
	GTG101X	£1.03	GASKET, thermostat housing, Klingersil	1	uprated material
49	GTS102	£3.40	THERMOSTAT, 74°C, hot climates	1	
	GTS104	£3.60	THERMOSTAT, 82°C, standard	1	
	GTS106	£4.20	THERMOSTAT, 88°C, cold climates	1	
12	CRCP350	£3.14	PLATE, 'patent', (metal)	1	
	CRST137	£1.80	PLATE, 'patent', (self adhesive)	1	
13	CRCP348	£4.62	PLATE, 'Austin', (metal)	1	
	CRST136	£2.90	PLATE, 'Austin', (self adhesive)	1	
14	CRCP349	£2.90	PLATE, 'MG', (metal)	1	
	CRST134	£1.14	PLATE, 'MG', (self adhesive)	1	
15	12A402	£3.71	CAP, oil filler, plastic	1	for standard rocker cover
	8G612CP	£5.20	CAP, oil filler, chrome	1	for replacement alloy
	8G612	£7.00	CAP, oil filler, steel, (matt finish)	1	rocker covers
16	12A501	NCA	ROCKER COVER, (standard)	1	
	WPA9007X	£37.00	ROCKER COVER KIT*, alloy, ribbed	1	kits inc. cover, cap, gasket

*Note: Please see the Accessories section for full details.

17	GUG705009VC	£1.20	GASKET, rocker cover	1	
	296-006	£11.45	GASKET, rocker cover, silicone	1	standard cover
	296-007	£14.15	GASKET, rocker cover, silicone	1	alloy cover

18	12A1968	£4.20	BRACKET, engine lift	2	remove after use
19	2A150	£1.12	NUT/STUD, rocker cover retaining	2	
	2A150CP	£3.00	NUT/STUD, rocker cover retaining, chrome	2	
20	1B2925	£1.03	SPACER	2	
	CAM6921	£1.44	SPACER, chrome	2	
21	1A2156	£0.65	CUP WASHER	2	
	12G679	£0.95	CUP WASHER, chrome	2	
22	12A1358	£0.40	SEAL, rubber	2	
23	N9YCC	£2.86	SPARK PLUG, (N9Y)	4	champion N5 originally fitted

Note: Original rocker shafts were located by the front pedestal. This front pedestal also acts as an oil feed pipe to the rockers. Modified rocker shafts are located by the second pedestal, this means the front pedestal is moved to the second pedestal position, the original second pedestal is discarded, and a new front pedestal with only an oil way is fitted (121926).

24	12A1950	£13.25	ROCKER SHAFT	1	with modified screw location
	12A1950Z	£12.23	ROCKER SHAFT, aftermarket	1	
	12A1950K	£105.00	ROCKER ASSEMBLY, recon/exchange	1	
25	12G1927	£6.50	PEDESTAL, rocker shaft	1	
26	12G1926	£7.73	PEDESTAL, rocker shaft, with oil-way	3	
27	2A258	£1.80	SCREW, pedestal locating	1	
28	2A515	NCA	LOCK PLATE	1	

Note: Original rockers are no longer available, they were either cast (2A553), or pressed steel (2A964). They can be replaced by using a sintered steel rocker (CAM289), or a forged rocker (12G1221). It is advisable to replace them in sets due to the difference in weight compared with the original rocker.

29	2A964	NCA	ROCKER ARM, pressed steel	8	not available,
30	2A533	NCA	ROCKER ARM, cast	8	see above note
31	2A21	£1.94	BUSH, rocker arm	8	for 2A533
32	12A1215	£5.40	SCREW, adjusting	8	cast rockers only
33	6K654	£1.36	LOCK NUT	8	
29	CAM289	£20.86	ROCKER ARM, sintered steel	8	bush not required
32	12H3376	£1.49	SCREW, adjusting	8	for sintered rocker
33	51K1178	£0.34	LOCK NUT	8	CAM289 only
30	12G1221	£10.40	ROCKER ARM, forged steel	8	Ideal for tuned engines
			(Must be reamed to suit rocker shaft).		
31	2A21	£1.94	BUSH, rocker arm	8	
32	12H3376	£1.49	SCREW, adjusting	8	for forged rocker 12G1221
33	51K1178	£0.34	LOCK NUT	8	
34	6K556	£2.10	SPRING, spacer	3	
	AEG392	NCA	SPACER, solid	3	replaces 6K556
					on tuned engines

Consumables

ill	Part Number	Price £ea.	Description	Req.	Details
NI	GEM317	NCA	GASKET REMOVER, (400ml)	a/r	
Gasket remover is a spray-on solvent foam which will soften most jointing compounds without the need to resort to scraping, simply wipe off the results. This removes the likelihood of scratching surfaces which really need to be as flat and scratch free as possible to ensure perfect sealing. More than one application may be needed for heavy residue.					
NI	GAC110	£3.66	WD40, 200ml	a/r	
	GAC111	£6.30	WD40, 400ml	a/r	
NI	600569A	£9.30	WELLSEAL, jointing compound, 100ml	a/r	
NI	153317	NCA	GREASE, copper, anti-seize, 10fl oz	a/r	
NI	LKLPK104	NCA	GREASE, copper, anti-seize, 25ml	a/r	
NI	GGL9041X	NCA	CORROSION INHIBITOR, Penrite	a/r	

Note: Water is a most efficient liquid for cooling engines, but it has two distinctive drawbacks. Firstly it freezes in winter, and secondly it does nothing to stop corrosion. Classic cars can feature large amounts of aluminium, copper, brass and bronze, so it is imperative that a corrosion inhibitor be used to protect the engine's cooling system.

There are four types of corrosion;

Deposits:	Calcium carbonates that form hard deposits and adhere to radiator tubes etc...
Oxidation:	The combining of oxygen and iron to form rust.
Electrolysis:	A chemical reaction between dissimilar metals which react with one another via water thus conducting electricity and deposits on the negative (cathode to anode) area.
Erosion:	A mechanical problem caused by water turbulence and flow.

NI	GEC2001	£4.32	ANTI FREEZE, Unipart, (1 litre)	a/r
	GEC2002	£7.60	ANTI FREEZE, Unipart, (2 litre)	a/r
	GEC2005	£17.80	ANTI FREEZE, Unipart, (5 litre)	a/r

It's not just during the winter that you need protection for your engine and radiator. The inclusion of the glycol based Anti Freeze not only stops the water from freezing up during the winter, during the summer it also acts as an extra coolant by removing the heat more efficiently from the block and dispersing it even in the worst traffic jam. It also helps to protect from corrosion.

Clutch & Brake Fluids

When did you last change your Clutch/Brake fluid?

DOT3 fluid ought to be completely discarded, DOT4 ('GBF4') should be installed and replaced every 2 years, as recommended by manufacturers. An alternative, especially if you are replacing master cylinders, brake calipers and/or wheel cylinders, is to thoroughly flush out the pipes and install Silicone fluid (DOT5 'ABF'), which is 'Non-Hygroscopic', so it doesn't promote rust problems in the hydraulic system. The bonus is that it won't damage paint work.

When silicone is in use it will provide years of trouble free braking and an end to the monotonous and expensive pastime of repairing or replacing worn or leaking hydraulic components. Racing Fluid (DOT5.1 'GBF5') really is the ultimate in brake fluid. Its anti-boil properties mean that even when the brakes get hot the fluid will remain efficient, rather than boiling locally (such as in the calipers) into useless vapour. Ideal on the race track or when the brakes are used to their limits. Due to its high 'Hygroscopic' nature, DOT5.1 Racing fluid should be replaced annually otherwise the quality and effectiveness will be drastically reduced.

Brake/Clutch Fluid (DOT4 Specification)

ill	Part Number	Price £ea.	Description	Req.	Details
NI	GBF4102	£5.45	BRAKE/CLUTCH FLUID, DOT4	a/r	500ml
NI	GBF4103	£10.74	BRAKE/CLUTCH FLUID, DOT4	a/r	1 litre
NI	GBF4104	£42.00	BRAKE/CLUTCH FLUID, DOT4	a/r	5 litre

Silicone Brake/Clutch Fluid (DOT5 Specification)

NI	ABF3	£18.00	BRAKE/CLUTCH FLUID, DOT5	a/r	silicone, 500ml
NI	ABF4	£30.00	BRAKE/CLUTCH FLUID, DOT5	a/r	silicone, 1 litre

Racing Brake/Clutch Fluid (DOT5.1 Specification)

Gearbox Identification

948cc Sprite I, II & Midget I (Gearbox 9CC/9CG)

As the original 948cc gears for the 9C & 9CG gearbox are no longer available, an alternative has had to be found. This is achieved by machining the 948cc gearbox casing and utilising the internals from the 1098cc Morris Minor Gearbox, with the improved baulk ring synchromesh on 2nd, 3rd & top.

1098cc Sprite II, III & Midget I, II (Gearbox 10CG/10CC)

The internal gears in the 1098cc Sprite/Midget gearbox are also no longer available, therefore the later 1275cc Midget gearbox assembly has to be used if the gears in the original gearbox are damaged.

The following components are for original 948cc & 1098cc Sprite & Midget gearboxes. We have listed parts that are currently available, plus components that we intend to manufacture in the near future. Some cars have had their original gearboxes replaced with 1098cc Morris Minor units. The individual components from these gearboxes are NOT interchangeable with Sprite/Midget internals. When stripped, the gearboxes can be easily identified.

Sprite I gearbox

- Smooth gearbox case
- Brass bearings for 2nd & 3rd gears
- Brass interlock collar between 2nd & 3rd gears

Sprite II & Midget I gearbox

- Smooth gearbox case, (948cc only)
- Ribbed gearbox case, (1098cc only)
- Roller bearings for 2nd & 3rd gears
- Steel collar between 2nd & 3rd gears

Gearbox Units

ill	Part Number	Price £ea.	Description	Req.	Details

Carburettors & Components

Note: Please see the Accessories section for full details of carburettors & components.

Twin (1 1/8") H1 SU's

Sprite I (948cc)

The Sprite MkI was originally fitted with SU's H1 type (1 1/8") carburettors, which are identified by having a single bolt securing the float chamber lid. The tag attached to the lid (if still there!) should say AUC863.

Frequently, the H1 carburettors are replaced by the later HS2 (1 1/4") types. These later carburettors have a float chamber lid retained by 3 screws around the circumference. The tag number (again if still there!) should be either AUC990 or AUD73.

Note: Before ordering parts/service kits, please verify type of carburettor fitted to your vehicle.

46	GHC11022	£1.94	CLIP, hose to valve & adaptor	2	
47	12H1405	£7.48	ADAPTOR, hose to manifold	1	
48	1B3664	£0.29	WASHER, sealing	1	

Road Wheels & Fittings

Note: Please see the Accessories section for our full range of alloy wheels.

ill	Part Number	Price £ea.	Description	Req.	Details
1	AHA5539E	NCA	WHEEL, steel, 13" x 3.5"	5	ventilated
2	AHA6455E	NCA	WHEEL, steel, 13" x 3.5"	5	from GAN2 17166, HAN7 26240
3	WWP458	£140.00	WIRE WHEEL, painted, 13" x 4"	5	
	WWC458	£195.00	WIRE WHEEL, chrome, 13" x 4"	5	
4	17H3613	£4.30	SPOKE, long, mild steel	a/r	60 spoke painted
	17H3984	£4.30	SPOKE, short, mild steel	a/r	wire wheels
	37H4967	£8.00	SPOKE, long, chromed stainless	a/r	60 spoke chrome
	37H4968	NCA	SPOKE, short, chromed stainless	a/r	wire wheels
5	7H1709	£0.40	NIPPLE, mild steel	a/r	painted wire wheels
	37H3651	£1.64	NIPPLE, chromed stainless	a/r	chrome wire wheels
7	AHA5217K	£27.40	STRAP KIT, spare wheel, (3 piece)	1	Sprite I
NI	242-856	NCA	COVER, spare wheel	1	
8	24A1032	NCA	CLAMP, spare wheel, (steel wheels)	1	
9	AHA6664	NCA	CLAMP, spare wheel, (wire wheels)	1	
10	88G322	£0.65	NUT, wheel, (steel wheels)	16	
11	AHH7317	£24.50	KNOCK-ON '2 EAR', RH, (LH thread)	2	12 TPI, use only
	AHH7318	£24.50	KNOCK-ON '2 EAR', LH, (RH thread)	2	with original hubs
	AHA7373	£24.60	KNOCK-ON '2 EAR', RH, (LH thread)	2	8 TPI, use when replacement
	AHA7374	£24.60	KNOCK-ON '2 EAR', LH, (RH thread)	2	hubs BTA 688/9 are fitted
12	AHH7315	£24.00	OCTAGONAL NUT, RH, (LH thread)	2	12 TPI, use only
	AHH7316	£24.00	OCTAGONAL NUT, LH, (RH thread)	2	with original hubs
	88G606	£22.50	OCTAGONAL NUT, RH, (LH thread)	2	8 TPI, use when replacement
	88G607	£22.50	OCTAGONAL NUT, LH, (RH thread)	2	hubs BTA 688/9 are fitted
13	2A8055	£37.50	HUB CAP	4	'Austin Healey' motif
14	AHA5660	£34.00	HUB CAP	4	plain

Note: TPI = Threads Per Inch, the lower the number (ie '8') the coarser the threads.

Wire Wheel Hub Conversion Kits (all models)

Wheels NOT included

ill	Part Number	Price £ea.	Description	Req.	Details
NI	GAC7017	£285.20	HUB CONVERSION KIT	1	2-eared knock-on type (Kit includes 4 hubs, fittings & precise installation/fitting instructions).
NI	GAC7027	£304.40	HUB CONVERSION KIT	1	octagonal nut type (Kit includes 4 hubs, fittings & precise installation/fitting instructions).

Note: A few Sprite I models were converted to wire wheels and disc brakes by the Donald Healey Motor Co. They used special discs and Dunlop/Girling calipers at the front. We are unable to supply any of the components for these vehicles, the later Lockheed discs and calipers are not directly interchangeable either.

Wire wheels for Sprites & Midgets were only offered by the factory as an optional extra in 1963 after the introduction of Disc Brakes and, the 1098cc engine, however, we have recently come across what we believe to be a factory prototype (circa 1962-63) equipped with wire wheels, but with slightly smaller calipers & pads!

Roadside Tools & Equipment

Note: Please see the Accessories section for our full range of wire wheel tools & spanners.

15	C27290	£25.00	HAMMER, copper/hide	1

15	51K1368	NCA	SCREW, back plate to stub axle, (1/4")	8	
16	GHF322	£0.14	Spring Washer, (5/16")	8	

Note: A few Sprite I models were converted to wire wheels and disc brakes by the Donald Healey Motor Co. They used special discs and Dunlop/Girling calipers at the front. We are unable to supply any of the components for these vehicles, the later Lockheed discs and calipers are not directly interchangeable either. Wire wheels for Sprites & Midgets were only offered by the factory as an optional extra in 1963 after the introduction of Disc Brakes and, the 1098cc engine, however, we have recently come across what we believe to be a factory prototype (circa 1962-63) equipped with wire wheels, but with slightly smaller calipers & pads!

Disc Brakes (1098cc)

17	BTA383	£8.80	BRAKE DISC,	2	(for steel wheels)
	BTA383GEO	£14.80	BRAKE DISC, geomet finish	2

6	2A4066	£2.50	STUD, wheel	8	
7	88G322	£0.65	NUT, wheel	8	for vented wheel AHA5539

Note: A few Sprite I models were converted to wire wheels and disc brakes by the Donald Healey Motor Co. They used special discs and Dunlop/Girling calipers at the front. We are unable to supply any of the components for these vehicles, the later Lockheed discs and calipers are not directly interchangeable either. Wire wheels for Sprites & Midgets were only offered by the factory as an optional extra in 1963 after the introduction of Disc Brakes and, the 1098cc engine.

Note: For full details of road wheels please see page 37.
Note: For full details of front brakes please see page 39.
Note: For full details of rear brakes please see page 40.
Note: For full details of brake pipes & hoses please see page 41-42.
Note: For full details of handbrake & fittings please see page 43.

Semi-Elliptic Leaf Spring

This diagram illustrates the exploded view of a semi-elliptic leaf spring assembly. The main components are labeled with numbers:

- 1**: The main leaf spring, shown in its curved, loaded state.
- 2**: A small cylindrical pin or bush.
- 3**: A mounting bracket or plate.
- 4**: A bolt or screw.
- 5**: A pin or bush.
- 6**: A nut or washer.
- 7**: A small pin or bush.
- 8**: A long bolt or screw.
- 9**: A pin or bush.
- 10**: A nut or washer.
- 11**: A small pin or bush.
- 12**: A small pin or bush.
- 13**: A small pin or bush.
- 14**: A small pin or bush.
- 15**: A bracket or plate.
- 16**: A bolt or screw.
- 17**: A small pin or bush.
- 18**: A bracket or plate.
- 19**: A small pin or bush.
- 20**: A bracket or plate.
- 21**: A pin or bush.
- 22**: A pin or bush.
- 23**: A pin or bush.
- 24**: A pin or bush.
- 25**: A pin or bush.
- 26**: A pin or bush.
- 27**: A pin or bush.
- 28**: A pin or bush.
- 29**: A pin or bush.
- 30**: A U-shaped bracket or plate.
- 31**: A curved bracket or plate.
- 32**: A bracket or plate.
- 33**: A bracket or plate.
- 34**: A bracket or plate.
- 35**: A pin or bush.
- 36**: A pin or bush.
- 37**: A pin or bush.
- 38**: A pin or bush.
- 39**: A pin or bush.
- 40**: A bracket or plate.
- 41**: A pin or bush.
- 42**: A pin or bush.
- 43**: A pin or bush.
- 44**: A pin or bush.
- 45**: A pin or bush.
- 46**: A pin or bush.
- 47**: A pin or bush.
- 48**: A pin or bush.
- 49**: A pin or bush.
- 50**: A cylindrical component, possibly a bush or pin.
- 51**: A pin or bush.
- 52**: A pin or bush.
- 53**: A pin or bush.
- 54**: A pin or bush.
- 55**: A bracket or plate.
- 56**: A pin or bush.
- 57**: A pin or bush.
- 58**: A pin or bush.
- 59**: A pin or bush.
- 60**: A pin or bush.
- 61**: A pin or bush.
- 62**: A pin or bush.
- 63**: A pin or bush.
- 64**: A pin or bush.
- 65**: A pin or bush.

Wire Wheel Hub Conversion Kits (all models)

Wheels NOT included

Note: See 'Road Wheels and Tools' for full details.

NI	GAC7017	£285.20	HUB CONVERSION KIT (Kit includes 4 hubs, fittings & precise installation/fitting instructions).	1	2-eared knock-on type
NI	GAC7027	£304.40	HUB CONVERSION KIT (Kit includes 4 hubs, fittings & precise installation/fitting instructions).	1	octagonal nut type

Note: A few Sprite I models were converted to wire wheels and disc brakes by the Donald Healey Motor Co. They used special discs and Dunlop/Girling calipers at the front. We are unable to supply any of the components for these vehicles, the later Lockheed discs and calipers are not directly interchangeable either.

Wire wheels for Sprites & Midgets were only offered by the factory as an optional extra in 1963 after the introduction of Disc Brakes and, the 1098cc engine, however, we have recently come across what we believe to be a factory prototype (circa 1962-63) equipped with wire wheels, but with slightly smaller calipers & pads!

Starter Motor (Standard)

Ill.	Part Number	Price £ea.	Description	Req.	Details
1	TYPE A		STARTER WITH THREADED PINION (Lucas No. 25022).		alternative types for reference only. all replaced by (3A), GEU9405.
2	TYPE B		STARTER WITH CIRCLIP PINION (Lucas No. 25079).		
3	TYPE C		STARTER WITHOUT INSPECTION BAND (Lucas No. 25149).		
3	GEU9405	£75.00	STARTER MOTOR, new	1	9 tooth - all models
	67H5010	£20.50	BENDIX, (pinion & barrel)	1	all models

Note: For Sprite I starter switches see page 61, for Sprite II & Midget I switches see page 62 and for Sprite III & Midget II switches see page 63.

Pre-Engaged (Geared) Starter Motor

These brand new (non-exchange) powerful starter motors are High Torque, meaning they will not suffer the same fate as the original 'Inertia' type, especially on high compression engines and, they are a direct replacement. No more costly motor rebuilds or excessive battery drain.

GXE4405X	£205.00	PRE-ENGAGED STARTER MOTOR	1
----------	---------	---------------------------	---

Dynamo

POLARISATION: Negative or Positive Earth system?

Note: When fitting a replacement dynamo, it must be polarised to suit your vehicles electrical system. Polarisation can be effected as follows; Fit the dynamo - without connecting it to the vehicles electrical system. Connect one end of a length of wire to either the 'live' (not earth) terminal of the battery, or the battery lead terminal (Not the starter lead) on the starter solenoid. Hold the other end of the wire against the 'field' terminal (the smaller of the 2) on the back of the dynamo for 'three to five seconds'. Polarisation is now complete. Remove the temporary wire and connect the dynamo to the electrical circuit.

948cc Engines (Mechanical Tachometer)

ill	Part Number	Price £ea.	Description	Req.	Details
1	AEJ49	£125.00	DYNAMO, new	1

All Models (Replacement Battery Terminal Clamps)

NI	GHF2750	£5.10	CLAMP, negative	1	
NI	GHF2755	£5.10	CLAMP, positive	1	
NI	518903	£2.75	BOLT, square head	2	
NI	GHF208	£0.20	NUT	2	

Battery & Battery Terminal Position

The body earth point for the battery is always on the left side of the bulkhead. When the correct battery is fitted, the fitted terminals should be nearer the bulkhead than the heater.

Ignition System

Note: Please see the Accessories section for full details of ignition system.

Exchange distributors come complete with distributor cap (item 3), but less clamp (item 2). They have push-on connectors for use with items 17a or 17b.

Instruments

As new and second-hand units are now almost impossible to obtain, we offer a overhaul & repair service for all gauges. On receipt of your own old unit, it will be checked, dismantled, reconditioned, and then tested. If, at any stage, it is found that your unit is not repairable, we will notify you. The correct specification gauge for each vehicle is shown here.

Sprite I (Drum Brakes - Smiths)

ill	Part Number	Price £ea.	Description	Req.	Details
1	2A9067E	£83.00	SPEEDOMETER, MPH, (SN 6155/10)	1	
	2A9077E	£83.35	SPEEDOMETER, KPH, (SN 6155/11)	1

General Hardware & Fixings

Following is a listing of the common fasteners used on Sprite & Midget cars. These fasteners are for general use and are not intended to replace those listed for specific applications elsewhere in this catalogue. To aid identification by terminology, a screw is threaded for its full length. A bolt is only part threaded with a plain unthreaded shank area between the head and the thread. The part number two letter prefix of SH means that the item is a Screw with a Hexagon head. The prefix BH means a Bolt with a Hexagon head. The first number defines the thread type, UNF = 6, UNC = 5. The second and third numbers give the thread diameter in increments of 1/16", e.g. 04 = 1/4", 05 = 5/16", 10 = 5/8". The fourth and fifth digits show the length in increments of 1/8", e.g. 04 = 1/2", 16 = 2", 23 = 2 7/8". The last digit defines finish, 1 = zinc plated. This coding system is only applicable to bolts and screws; nuts & washers are coded by a similar system that follows some of the above principles.

Late Sprite & Midget 1967-79 **Restoration Parts**

Ordering Information

Notification of prices

Due to the volatility of world markets and currency fluctuations the prices in this catalogue are subject to change. Moss make every attempt to keep prices competitive and stable, however in common with all other suppliers in our industry, we reserve the right to alter these prices without prior notice.

For the latest prices, please visit our website www.moss-europe.co.uk. All prices are per unit (unless otherwise stated) and include (UK) VAT at 20% (where applicable) and are correct at the time of going to print. Postage and packaging is not included. E&OE. Where the price is replaced with NCA this part is Not Currently Available. Please visit our website (moss-europe.co.uk) or call our sales staff for the latest availability information or to enquire if we can offer an alternative part.

Product supersessions

Moss Europe's policy is to detail the most up to date part information in our catalogues. Where possible parts are kept to original specification. However, in some instances we have to supersede to the most viable alternative product to maintain supply and keep cars on the road. Every effort is made to ensure high quality products.

UK ordering

We accept orders by mail, telephone, e-mail, fax and on-line at www.moss-europe.co.uk. If you have the opportunity, we invite you to visit one of our branches. Remember, supplying details of your car, (i.e. engine, commission or Vehicle Identification Number (VIN) LHD or RHD, year of manufacture and any modifications) saves time and helps us to help you. Please inform us of your customer number, as this will speed up the processing of your order.

Overseas ordering

We accept orders by mail, telephone, e-mail, fax and on-line at www.moss-europe.co.uk. If you visit the U.K. please come and visit one of our branches. When ordering, please ensure that you enclose full details of your name, address and customer number, plus details of your car (i.e. engine, commission or Vehicle Identification Number (VIN) LHD or RHD, year of manufacture and any modifications).

Please note: Overseas orders are often subject to local import duties, taxes and Customs clearance, which will need to be paid for at the point of entry. These charges are NOT included in the price of the goods or delivery prices. All relevant Customs forms and documentation needed to ensure the order arrives with the minimum of delay, will be included with your shipment. If you have any special requirements, please contact us to discuss them. Delivery charges are dependent upon the size and weight of the shipment. If a quotation is required prior to placing an order, please contact the export department at your chosen branch and they will be pleased to supply a full quotation.

Parts back-order system

A back-order system is used when a part is not in stock at the time of ordering. If the item is expected to become available within 6 months, then it will be put on back-order, unless the customer instructs us otherwise. When we have the parts in stock, the back-order will be processed automatically and the item will be dispatched to the customer. If the particular part becomes No Longer Available (NLA) or does not become available within 6 months the back-order will be cancelled. If you are unsure when you placed a back-order contact your local branch.

Dispatch & delivery methods

Orders for delivery in the UK may be dispatched by regular post for small/lightweight items, larger items may be dispatched via a courier. Please call us for the best delivery option for your order and the latest delivery prices. For delivery outside the UK we offer the following services.

- **Economy delivery (by road):** 2 to 5 days (approximately).
- **Express delivery (by air):** 1 to 2 days (Guaranteed) - next day service to most countries.
- **For small and low value orders we also use airmail.**

For these services, please ask for prices and the best delivery option when you place your order. Most deliveries (except airmail) are 'trackable', (inc: e-mail updates and internet access for selected carriers). Please remember, all carriage charges are dependent on weight band, volume, destination and delivery time. If a quotation is required prior to placing your order, please contact a member of the sales department. Alternatively, you can arrange your own delivery and dispatch.

Windscreen delivery information

We always suggest that windscreens should be collected from one of our branches to ensure you are able to transport your glass with the utmost of care. However, we understand that this is not always possible.

To minimise the possibility of damage to the windscreen in the shipping process, it is now Moss Europe's policy to ship windscreens packed in a specially designed heavy duty 'Tri-Wall' cardboard box. The price of this box is £35.00 (inc VAT), non-refundable and is not included in the price of the product. The crate's dimensions will also increase shipping costs, particularly in EU countries. The crate dimensions are 150cm x 33cm x 74cm. The maximum volumetric weight is 92kgs. For more information please contact your nearest Moss branch.

Hazardous goods delivery information

At the time of going to print, Moss Europe Ltd conforms to international shipping regulations regarding packaging and transportation of Hazardous Goods by road and sea freight (only). Due to these international shipping regulations and licencing rules all goods deemed as Hazardous are currently available for shipping to the UK and Europe only. If you place an order containing Hazardous goods and your shipping address is not in the UK or Europe, we will not be able to ship this item to you. Please contact your local branch or visit our website moss-europe.co.uk for the latest delivery information of Hazardous goods.

Quotations & payment methods

We will be pleased to provide a full parts quotation detailing price, availability and relevant shipping costs. Payment may be made by cash, personal cheque (to the card guarantee limit), Certified Bank Draft, Sterling Travellers Cheques and credit or debit card including: Mastercard, Visa, Delta. If you intend to make payment by Cheque or Bankers Draft when

using our fast mail-order parts service, please confirm parts availability and carriage charges. We can accept payments using PayPal for website, email and phone orders.

Value added tax (VAT)

Value Added Tax (VAT) at the current rate will be levied on all orders being dispatched to all countries within the European Community. EU countries may be charged at their local VAT rate, please contact us or see website for details. VAT is not charged on goods dispatched to countries outside of the EU. However, such orders are often subject to local import duty, taxes and Customs clearance, which MUST be paid by you at the port of entry. Such charges are not included in the cost of the goods or delivery prices.

Exchange units

We are able to offer a full rebuild service on numerous major components in our product range. We offer this service as an alternative to direct replacement parts, or when a brand new item is no longer available. However, the continuity of this exchange scheme needs the understanding and co-operation of our customers in relation to several important points: It is important to remember that "rebuild" does not mean "brand new". Rebuilding a unit involves stripping, cleaning, inspecting and re-assembling the unit. During this process, parts showing signs of wear will either be completely replaced or suitably renovated. However, it is not always feasible for major sub-components to be replaced with brand new ones, for example, an exchange engine will not have a new block. Due to the nature of certain product lines, some items can only be offered on a "one for one" exchange basis. This effectively means that you must offer us a viable unit before we can release a fully rebuilt item from our stock. In some instances we can only carry out reconditioning of your own unit. Our staff will inform you if this is the case.

All exchange units are subject to a surcharge. This surcharge serves two purposes; firstly, it acts as an incentive for you to return your old unit, and secondly it provides us with financial cover if your returned unit proves unsuitable for exchange purposes.

Whether or not your returned unit is suitable for exchange purposes cannot be ascertained until it is made available to us for inspection. As a general rule, suitable for exchange basically excludes any items that are beyond reasonable repair (e.g. crankcases pierced by a connecting rod) or units irrevocably damaged. We are also unable to accept units unless they are returned in whole, complete form (i.e. differential units which are returned partly stripped with no bearings and all the shims missing are not generally accepted), nor do we accept a "box of bits".

Surcharges will only be refunded once our core department has passed the item as serviceable. Under no circumstances can any exchange unit be shipped overseas until we receive your original unit. We have predetermined prices for our exchange units based on our experience of repair costs for a gearbox, axle or engine. Occasionally, however, the damage to the unit is so great that we will contact you before beginning work on your unit to advise you of any additional cost that may be incurred during the rebuild of the unit. We can return the unit (at your cost) if this proves unacceptable.

'Old unit' returns

Exchange items including reconditioned engines are subject to a surcharge that is refunded when a rebuildable unit (core) is returned. When you receive the rebuilt unit, attached to it will be a Core Return Authorisation Tag. This tag must be removed from the rebuilt unit and attached to the returned core in order to receive credit. Cores must be returned within 90 days of purchase in the original box, carton or engine cradle supplied with the rebuilt unit. Cores must be shipped clean and empty of fluids. Cores must be complete, assembled and rebuildable to receive credit or refund. You must pay all shipping charges for the return of the core and these charges are not refundable.

Warranty

All parts are warranted against defects in materials and workmanship for a period of twelve (12) months from the date of purchase. The warranty does not cover failure resulting from incorrect installation or misuse; failure during any competition, motorsports or track events; failure of any, or caused by any, related component. The warranty does not cover labour charges, nor will a warranty settlement be greater than the cost of the original component. Should you need to make a warranty claim, please contact us immediately at the branch of purchase. We will then advise you as to the best course of action. With all warranty claims a copy of the original purchase invoice must be produced.

Warranty returns

Parts that fail in use may be returned for 12 months from the date of purchase. Returns must be accompanied by the original invoice - no warranty claims will be paid without a copy of the original invoice. Return freight will be reimbursed. Electrical parts returned for warranty will be tested and if found functional, no return credit will be given and the part will be returned. Reimbursement is made by the original payment method. Complete the return form included in each order, pack the items securely and use the shipping return label supplied.

Non-warranty returns

All uninstalled parts, in their original packaging may be returned within 90 days for any reason. A copy of the original invoice or the picking label (which is generally attached to the original packaging) must accompany the return. Return freight is paid by the customer. If the return is due to our error, the return freight will be reimbursed. Parts returned outside of this policy or in non-resalable condition may not be accepted or may be assessed a 15% handling fee. Reimbursement is made by the original payment method. Complete the return form included in each order, pack the items securely and use the shipping return label supplied.

Customer service

We value your custom and wish to ensure that you receive the very best service. Every effort will be made to provide you with Quality Parts and Expertise in a relaxed, helpful and friendly manner. Should you consider the service you receive from us to be unsatisfactory, or you have any problems with the part(s) purchased, please advise a member of the sales team at the originating branch. If the matter is not resolved to your satisfaction, please contact our Customer Services Department and we will do our very best to resolve the issue, either email: customerservices@moss-europe.co.uk or write to: Customer Services, Moss Europe Ltd Unit 16, Hampton Business Park, Bolney Way, Feltham TW13 6DB England.

What can I do to make my Sprite or Midget go faster?

There really isn't a simple answer to this question. For instance: Do you want higher speeds on the motorway or do you want more mid-range torque? Do you drive your car fairly hard on a daily basis, or just use it on weekends? Would you like that little bit more power, or do you want maximum BHP? Or, do you just want the car to be quicker through bends? Then we could ask, have you, or are you going to, upgrade the brakes? Are your suspension and/or steering bushes/components OK? Will your transmission and drive train handle more power/speed? Is your car standard, or has it been previously overhauled/uprated?

On the following pages, you will find a range of quality components that will improve engine performance, braking, steering and the handling of your classic and, if you want to make it a real head turner, complete the transformation by fitting a set of wide section alloy wheels. Please don't forget, before increasing the power output and speed of any vehicle, you should ensure that your brakes, steering, chassis etc. can cope with the modifications, and, a roll bar is a very sensible investment... for all open top sports cars.

Note: Descriptions And Dimensions.
As we have no control over installations/modifications (whether previous or current), it is the sole responsibility of the user to ensure safe and correct fitment, tolerances and clearances. Manufacturers/suppliers descriptions and dimensions are given in good faith at the time of publication. Errors and Omissions Excepted.

Moss Special Tuning Front Anti-Roll Bar Handling Kits

The simplest and most cost effective way to improve your vehicle's handling is to fit one of our front Anti-roll bar handling kits. All Sprites and Midgets suffer from an inherent handling problem. The standard front suspension design allows body roll which induces understeer. This is the tendency of the car going straight on when steered into a corner because the slip angle of the front tyres is less than that of the rear tyres. With it's rear wheel drive design, the Spridget is more comfortable and stable when this understeer has been reduced towards what is known as Oversteer. This is the tendency of the car to turn into the corner because the slip angle of the front tyres has become greater than the rear tyres.

Moss Special Tuning anti-roll bar handling kits have been very carefully produced as complete packages to suit each model. Research has shown that the requirements for each model are different, because the anti-roll bar provides the key to improved handling. We focused our research and testing on all the production anti-roll bars, as well as testing many experimental units. From this work, the correct components were selected to provide excellent roadholding while preserving the ride quality, without the need for other modifications.

Note: When carrying out any suspension modifications, it is vital to ensure that all other components are in good working order to handle the increased cornering speeds and, to maximize the benefit of any modification.

Front Anti-Roll Bar Handling Kits

The standard front suspension design allows body roll that induces instability. Fortunately this situation can be easily rectified by fitting one of our well proven handling kits. The inherent problem with the handling of these models is roll-induced understeer making high speed driving somewhat difficult. Our handling kits are designed to reduce body roll, whilst retaining good ride quality.Each kit includes a stronger front anti-roll bar with uprated centre mountings, plus, uprated rear shackle bushes to reduce rear end steering caused by lateral spring movement. The chrome bumper models use our 11/16" anti-roll bar, and the rubber bumper models require our 3/4" anti-roll bar.

ill.	Part Number	Description	Req.	Details
1	TMK30850	FRONT ANTI-ROLL BAR HANDLING KIT	1	11/16" dia, Chrome Bumper
NI	TMK30950	FRONT ANTI-ROLL BAR HANDLING KIT	1	3/4" dia, Rubber Bumper

An Introduction to the Front Anti-Roll Bar

As mentioned earlier, the handling is mainly controlled by the front anti-roll bar. For those owners who wish greater control of their vehicles, here we list the full range of bars together with the basic recommendations. Increasing the diameter of the bar will progressively reduce body roll and understeer tendencies. Too strong a bar will allow understeer to develop and will increase the harshness experienced on bumpy roads, making the car twitchy. Larger wheels and tyres may allow a stronger bar to be used due to the increase in unsprung weight. The amount of load transferred by the bar is proportional to the Square of the bars diameter. Competition cars will usually benefit from the fast road bar when using slick or competition tyres, they are usually much lighter than standard, so may benefit from a smaller bar which can be selected from the tables.

Front Anti-Roll Bar

An uprated front anti-roll bar will help you get the full cornering benefit from your classic, even if you haven't modified the suspension, but, if you are considering increasing the engine power and performance, it is a very wise investment. It is important not to fit too stiff a bar, as this will ruin the ride comfort, transmitting road shocks through to the driver and passenger.

The later cars were fitted with a 9/16" diameter bar as standard, we have found the ideal anti roll bar for a standard road car is 5/8" diameter, a modified car will handle better with the 11/16" diameter bar. Competition cars benefit most from the 3/4" or 7/8" bars depending upon their specification, but, these bars can prove to be too stiff for road use and will push the handling towards understeer again. Our experience has shown that the original bar end stops are not required for the competition bars, though they should be used on road bars.

ill.	Part Number	Description	Req.	Details

NI	11H462K	END STOPS, 11/16" dia	1	

General Front & Rear Suspension

As well as fitting an anti-roll bar handling kit, many owners want to modify their cars further for fast road or even competition use. On Sprite and Midget sports cars the front suspension should be stiff and the rear pliable, this reduces body roll at the front, whilst also lessening the chance of lifting the rear inner wheel when cornering hard.

Note: When carrying out any suspension modifications, it is vital to ensure that all other components are in good working order to handle the increased cornering speeds and to maximize the benefit of any modification.

Semi-Elliptic Rear Leaf Spring

These Sprite and Midget models are fitted with a semi-elliptic full length rear spring. We can offer 1" lowered springs to reduce the tendency for the car to oversteer and to help level the car when lowered front springs have been fitted. For the competition enthusiast we can supply a lowered and reversed rear spring dropping the car 2.5" although these cars are usually lighter than standard, reducing this effect.

All new rear springs are supplied with a new standard front eye bush. A much tighter feel for the handling can be achieved by replacing the standard suspension bushes with either polyurethane or nylon. Nylon has been used on competition cars for many years, it is hard, whereas the modern polyurethane bush has a softer edge and is more easily installed. Road cars can benefit greatly from polyurethane bushes without the harsh ride associated with nylon. The fitting of nylon bushes is best left to someone with engineering experience.

ill.	Part Number	Description	Req.	Details
Chrome Bumper Models				
NI	MGS40820	REAR LEAF SPRING, lowered 1"	1	fast road/sport
NI	MGS40821	REAR LEAF SPRING, lowered 2.5"	1	competition
Rubber Bumper Models				
NI	MGS40920	REAR LEAF SPRING, lowered 1"	1	fast road/sport
NI	MGS40921	REAR LEAF SPRING, lowered 2.5"	1	competition

Note: Uprated Rear Spring, must be fitted in pairs.

An Introduction To Anti-Tramp Bars

The use of anti tramp bars is highly recommended for cars which have more than standard power available. They are fitted between the rear spring front eye bushes and the centre spring mountings on the axle by special brackets which are supplied as part of the conversion. When power is applied suddenly, usually from a standing start, the rear leaf springs tend to wind up into an S shape, and then revert to normal in a series of hops, referred to as tramping. Anti tramp bars restrict flexing of the front half of the leaf spring when under extreme loadings, by allowing only vertical movement of the axle. Thus deprived of its natural twisting motion the axle can no longer tramp.

Note: When carrying out any suspension modifications, it is vital to ensure that all other components are in good working order to handle the increased cornering speeds and, to maximize the benefit of any modification.

High Capacity Fuel Pumps, Filters & Regulator

The standard fuel pump may not be able to maintain adequate fuel pressure at higher engine speeds. The range of Facet high pressure electric fuel pumps however, suit all modified applications, the position in the car where the pump is mounted will determine which model is used.

The cylindrical Interrupter pumps can be fitted to the front or rear of the car and can pull fuel up to 18" from the bottom of the fuel tank.

The Cuboid Solid State pumps must be mounted close to the tank and below the fuel level, the installation instructions must be adhered to. They can pull fuel up to 12" from the bottom of the fuel tank and the filter union must be fitted to the suction side of the pump.

Both types of pump are supplied in negative earth only, they come complete with mounting bobbins and unions, you will have to re-plumb the fuel system around the new pump using a combination of standard pipes and hoses. Fine-tuning of the fuel pressure can be easily achieved by installing a pressure regulator, we can supply either a simple regulator or a filter regulator with a replaceable filter. We have the road competition version with 1/4" and 5/16" connections and the larger competition version with all 5/16" connections. With safety in mind, we also supply an Inertia fuel cut off switch, so that in the event of an accident, fuel delivery is cut-off.

Engines & Components 1275cc

Tuning the A Series Engine

Tuning the A series engine is a fairly simple procedure with no really difficult areas or particular vices. All recommendations given must be taken in line with the projected type of engine specification desired, therefore only the general lines to be followed have been roughed out.

Standard SU HS2 carburettors will be improved by the use of K&N filters. The next area for attention is the exhaust system where reasonable results can be gained. Cylinder head gas flowing is very important on this engine. Carburation is an important improvement area and depending on the customer's proposed use for the car there is a wide range of conversion kits to choose from. Changing the camshaft profile will obviously improve top end breathing considerably, but it is a major exercise as engine removal is usually required to complete an installation. Alternatively, you could fit one of our Stage 2 Full engines.

Is Your Engine Standard?

Before you start installing modified engine parts please take a few moments and check to see if your engine unit is standard. It may be that the cylinder head has been skimmed and/or the cylinder block has been bored-out. This is especially important when fitting any modified cylinder head, as the compression ratio has to be matched to the engine specification.

Performance Camshafts 1275cc

All the Kent Camshaft applications/part numbers below with the suffix 'S' are for the original Star drive oil pump/camshaft as used on all 1275cc models. If you have changed your camshaft and oil pump to Metro Slot, use the suffix 'M' on the part number. All Piper Camshafts with the suffix 'E' are Star Drive unless otherwise stated.

Note: 1098cc models used a pin drive oil pump/camshaft.

To assist in selecting a suitable camshaft we have prepared a table (below) showing their various characteristics, these will change from engine to engine and with other modifications such as carburettor or valve size. A scatter profile is where the cam timing on No. 2 and 3 engine cylinders has been altered slightly to combat the poor scavenging of the siamese port design. This will benefit both the tickover and high end performance. Care must be taken to ensure that installation is carried out correctly and that all components work together or you will not get the expected power output or reliability. It is essential that the new cam is fitted with new followers as they mate with the lobe that they run on and should never be used on another lobe.

Lightened and Tuftrided followers wear more slowly and put less load on high lift cam lobes, they are also manufactured with a drainage hole. Another essential is the special lubricant that must be used with all new cams, it provides vital lubrication during initial starting and protects your cam from extreme wear in its first minute of use. Don't forget the cam timing degree disc, TT2929, you will need this to set your cam timing, or, camshaft assembly lubricant. (S/T = Special Tuning)

Modified Cylinder Heads 1275cc

The A series engine responds well to improvements to the cylinder head, both in porting and gas flow. It is possible to interchange heads from other models but check carefully the combustion chamber capacity for the compression ratio and the clearance between the fully open valves and the block. The best head to use is the 12G940 casting with an 11 stud configuration, this is from the 1275cc Mini Cooper S.

Engine reliability will benefit from fitting the extra two studs although the block will need drilling and tapping to suit. The head gasket will need changing too, for the extra studs, the traditional competition gasket needs soaking in water before use or we can highly recommend the Metro Turbo head gasket for all applications. When swapping components between models care should be taken to ensure compatibility. Fuel is predominantly unleaded now and all our heads are modified for lead free fuel. We suggest that you keep the compression ratio to 9.5:1. The shortage of original heads may require that the work is carried out on your own unit.

We will also need to know details of your engine cylinder bore size and piston type, to enable us to arrive at the correct compression ratio when working on your own unit. We can supply a new Alloy replacement head, this comes bare, or with 33.3mm inlet valves and 29.4mm exhaust valves, the chamber is 23cc and the head has a thick deck to allow room for skimming. Heads can be modified to a higher specification, please contact your local Moss branch for full details.

Tuning the Midget 1500cc Engine

The order of priority when tuning the 1500cc engine is to first improve gas flow through the engine before altering the camshaft profile. This is because the Midget 1500cc uses a Triumph engine, the listings in this section are based on the expertise and wide range of products from the long established TriumphTune side of the Moss tuning division. Due to the engine bay design of the Midget 1500cc, the engine tends to run very hot, and, it also tends to be over-revved in modern day traffic conditions.

The engine is a long stroke design best suited to a maximum cruising rev range of between 4500 to 5000 rpm. When Cruising on the motorway the engine is likely to be turning at the top of its ideal rev range, if not over the top! Over-revving combined with lack of sufficient cooling create reliability problems with 1500cc engine installation. The engine can be made to produce reasonable power with reliability if the cooling is improved and the unit modified to run safely at higher revs. An oil cooler is essential for any Midget 1500cc.

With regard to improving performance on UK and European cars the first modification is the fitment of K&N filters, which when combined with the sports exhaust becomes the first stage of tuning, this will produce an increase of approximately 10bhp at the wheels.

Breathing improvements are always most important on this engine, so the next item is a gas flowed cylinder head, followed by a change of camshaft profile. When carrying out any of the latter modifications, the bottom end, crankshaft etc... must be checked to ensure its condition is sound. If renovating the bottom end of the engine, the crankshaft may be reground and balanced, together with a +60 thou. overbore and careful re-assembly of the unit, a good, powerful engine with reliability may be obtained.

Upated Rocker Gear & Cam Followers 1500cc

All cars can benefit from a replacement tufridged rocker shaft, they will resist wear and breakage especially when using high revs.

Note: The Tufridged hardened shaft must be thoroughly purged of the salts used in the hardening process, before it is fitted.

Before fitting any rocker shaft it is essential to make sure that the end plugs are in position. The friction and the rocker side loads normally associated with the standard rocker gear can be reduced and the location made more positive, by fitting the three piece steel spacer set instead of the standard shaft springs. Pedestal Shims are for use with standard rockers in conjunction with a higher compression cylinder head, enabling the correct rocker angles to be obtained. They have a nominal thickness of 0.040" and are supplied individually.

Roller Rockers are designed to operate the valves with less resistance and more efficiency. The power increase with the use of these rockers is approximately an extra 10 bhp, the power band can also be extended. It is preferable to maintain 108° to 110° peak to peak centres on cam profiles if these rockers are fitted. The steel rockers are made with needle roller inserts and have solid spacers ready fitted.

The end roller tips are made in high quality steel for long life. The Roller rockers are also designed

to give a higher lift ratio, 1.65:1 against the standard ratio of 1.5:1. The design is also specially strengthened against deflection at any time in the operating sequence. TT1408 valve springs must be used with this rocker assembly.

Are You considering fitting our High Lift Roller Rocker Conversion?

Before fitting the high lift rocker conversion, you will need to verify the profile of your camshaft and valve springs. The higher the lift of the camshaft, the less likely you will need to fit this conversion without further advice. If in doubt, please contact your local Moss branch.

Upated Valves, Springs & Pushrods 1500cc

The standard type of push rod is adequate for road use. The tubular type is recommended for racing as they are stronger and are supplied shorter to suit a high compression cylinder head. They are also essential if using roller rockers.

It is essential to check the valve springs for coil binding, being solid at maximum lift, when using higher valve lifts. TriumphTune springs are designed for high lift cams. Remove lower spring collars if the TT springs are used - they are not required. The TT1307 springs are for road and sprint use, for greater lift and full competition TT1308 springs can be used. The large diameter set TT1408 should be used with the high lift rocker kit.

Upated valve springs are designed for TriumphTune and are suitable for all performance profile camshafts using the standard rocker ratio. Our competition springs are available in 2 specifications, standard diameter are an interference fit, allowing up to 9000 rpm and a maximum of 0.490" valve lift. Larger diameter springs allow better control of the valve for high lift and high rev. applications. Standard valve caps are strong enough for all applications, however TriumphTune light-weight alloy caps with a weight saving of approximately 25:1 also reduce valve loading and therefore wear on cam lobes.

Our Bronze alloy valve guides reduce friction and improve reliability, especially when the engine is under heavy load. They are highly recommended for all heads, especially on competition engines. They are shortened and reshaped for improved flow, the inlet guides are bullet nosed and the exhaust guides square ended to suit the head design. Moss TriumphTune competition valves are specially reshaped and gas flowed to give maximum flow once the seats and throats in the heads have been shaped to suit. All valves are made in EN21/4N stainless steel, for long life and maximum reliability. and are sold individually.

Performance Camshafts 1500cc

Camshafts are available as reprofiled/exchange units or New, please state preference when ordering. To assist in selecting a suitable camshaft we have prepared a table showing their various characteristics, these will change from engine to engine and with other modifications such as carburettor(s), cylinder head, valve gear or valve size.

Care must be taken to ensure that installation is carried out correctly and that all components work together or you will not get the expected power output or reliability. It is essential that the new cam is fitted with new followers as they mate with the lobe that they run on and should never be used on another lobe. Lightened and Tuftrided followers wear more slowly and put less load on high lift cam lobes, they are also manufactured with a drainage hole. Another essential is the special lubricant that must be used with all new cams, it provides vital lubrication during initial starting and protects your cam from extreme wear in its first minute of use. Don't forget the cam timing degree disc, TT2929, you will need this to set your cam timing, or, camshaft assembly lubricant.

IMPORTANT NOTE: All TriumphTune camshafts are profiled on new blanks. For fast road profiles, existing camshafts may be reground using the customers own unit (CUT), but this is entirely at the customers risk as we cannot guarantee the integrity of the original Triumph camshaft during the re-profiling process.

Note: The power range and upper rev limit for race camshafts is dependent on individual engine preparation and reciprocating parts.

Camshafts Explained 1500cc

The 1500cc unit is designed more for low speed power. For this reason most of the profiles are designed for torque improvement rather than greater power output at high engine revs. However the Midget 1500cc suffers from having the wrong gearing for the engine so it is necessary for some degree of compromise to be made for modern traffic conditions. Remember that with a standard capacity engine the power band will be effective higher up the rev range than would be the case with an enlarged capacity unit. All camshaft profiles must use TT valve springs, and we strongly recommend you fit a Duplex Chain Kit. Be aware that road and race cams mean just that. Road cams will not produce any results whatsoever on the race track - rainy days excepted!

Blueprint	Ideal for standard class competition.
Road 83 & 89	These are a very good stage 1 camshaft suitable for road cars equipped with SU HS4 carburettors.
Fast Road 83	For owners who, as a result of a fair amount of town driving, require a very good all round profile for use with either SU or Weber carburettors.
Fast Road	Best used with Webers, recommended more for open road driving, where the engine may be used more at high revs.
Fast Road 89	A new profile for open road use with Weber carburettors giving more mid to top end power.
Sprint 83 & 90	Although these cams can be used with modified road engines, they are primarily intended for track work.
All Race Cams	Suitable for full race engines, only where maximum power - not tractability, is required.

Valve Spring (When using Standard Rocker Shaft)

- A) Use TT1307 double springs, without any lower collars or spacers. (Installed Height: 33 < 34mm).
- B) Use TT1307 or TT1308 depending on application or intended use. (Installed Height: 33 < 34mm).
- C) Use TT1408 double springs, without any lower collars or spacers. (Installed Height: 32 < 34mm).

Engine Cylinder Block Modifications (1500cc)

Engine Block

All work must be carried out in clean conditions if reliability is to be expected. Specialist work that may be required includes polishing and smoothing main bearing caps, plus shot peening to relieve surface stress, they can then be reshaped to give a uniform cross section. For racing use, fit 1/4" longer high tensile bolts to the centre main cap, bottom tap the holes to ensure the bolts do not bottom out. Remove the top three threads from the centre main by counter boring, to spread the load deeper into the block. Remove excess casting flash from inside the block, do not grind any machined areas. Steel centre main caps can be supplied, but are not normally required, it is possible for racing to increase oil supply to the centre main, as this in turn supplies the connecting rods. Drill out the feed hole to 5/16", entry is made from the oil gallery end. The distributor bush will also require removal. Ensure all oil ways are clear, not only of deposits, but also of swarf from production machining.

Pistons

For any competition or fast road engine, use only solid skirt three ring pistons. Moss can offer standard production pistons, plus over sizes, or alternatively Triumph TR6 pistons, standard TR6 pistons may be used in a +.040" bore 1500 block, +0.020" in a +0.060" over bored block. The TR6 piston is very sturdy and quite light, as it is shorter in pin to deck height. It is necessary to machine the block (approx. 0.0165") to suit these pistons, this then gives zero piston height. Then counter bore the block as original (if the later type of head gasket is being used). Counter bore dimensions are 3.175" x 0.030" deep. Each piston will require 0.020" to be removed above the top ring and then radiused to the piston top to give clearance with the head gasket if using zero deck height.

Crankshaft

In engines for fast road use, standard bearings are adequate. For racing use MGB bearings, part no. AEB4512, +0.010" oversize, which necessitates regrounding the crank to 1.8665" - 1.867" diameter.

Engine Cyl. Block Modifications (1500cc) (Cont.)

Crankshaft

These bearings easily fit the journals and only require the edge of the tags to be filed to locate in the con rod properly, use a radiused edge on the crankshaft grind. The rotating assembly must be balanced, Tuftride hardening is also recommended. For racing, the crank can be micro polished an extra 0.001" under-size for clearance, thereby assisting in oil supply to the surfaces. The main bearing oil supply holes can be tear drop shaped in the direction of rotation, again to assist oil supply, this is only really needed for sprint and race engines.

Connecting Rods

Always rebuild an engine using new con rod bolts, preferably higher grade material and renew the little end bushes, reaming to size.

General Information for Sprites & Midgets

This section will give you further information and specific details on tuning theories and rules for the Sprite and Midget.

Suspension Characteristics

Modifications to the suspension are aimed at improving handling and road holding. The primary way of changing these characteristics is to alter the car's tendency to over steer or under steer. The latter two terms are defined thus:

Under Steer

The car still tends towards the straight ahead, even after the front wheels have been turned into a bend, the slip angle of the front wheels is less than that of the rear wheels.

Over Steer

When the car is steered into a bend, the rear end of the car will increase the turn in angle by tending towards the outside of the bend, the slip angle of the rear wheels is therefore greater than that of the front wheels. There are many reasons for these two situations and hopefully as many ways of changing them. The aim, certainly on a road car, is to produce a 'neutral' chassis, which is easy to drive quickly and safely.

Front Coil Springs

One car can vary considerably from the next, it may be found that on some cars the road springs do not reduce the height, because the originals have sagged to a lower ride height through old age or damage. For this reason, quoting, 1" lowered springs has no real meaning unless the original factory specified ride height of the car is known. The relationship between the new spring's fitted length and the resulting ride height is a ratio of approximately 5:8, i.e. if the spring's fitted length is 5 units shorter, the reduction in ride height will be 8 units, the amount increasing because the lower wishbones do not sit horizontally on the car.

Nylatron Bushes

Nylatron, a compound of nylon and molybdenum disulphide, is an extra tough material designed for high load conditions with low rotational movement. It's main advantage is that, due to the molybdenum disulphide, it requires very little lubrication. The use of a copper based grease, part No. 153317 on the pivot pin inside the bush, is all that is usually required.

What Problems might Nylatron cause?

As it is a great deal harder than standard rubber bushes, road noise and any harsh surface vibrations will be transmitted more readily into the car. A nylatron bush will alter the way a joint works, a rubber bush, gripping both the pivot within it and the sleeve around it, will allow its outer surface to twist over itself. The nylatron equivalent, having no obvious elasticity must be given clearance between itself and the pivot to allow free rotation. The amount of clearance has to be judged while fitting the component, it must not be excessive, or the benefits of the bush will be lost.

As an example, nylatron rear spring shackle bushes should allow an otherwise unattached spring to swing easily under its own weight. In an instance when a pivot nut would normally be nipped up to hold a rubber bush tightly, but now gently secures a nylatron item instead, it is suggested that an extra lock nut may be required.

As the bushes are primarily designed for competition use, they may require slightly modifying to suit the customer's own pivot pin or bolt. The bushes supplied by Moss Special Tuning are injection moulded for consistent quality, this therefore means that adapt to fit operations should be kept to a minimum, but may still be occasionally needed to obtain the best results. Nylatron bushes should be checked over regularly and re-tensioned or replaced as necessary.

Wheels

Even different makes of tyre, let alone different widths or profiles, aspect ratios, tend to affect road holding of the car much more than most owners realise, just by changing to another brand the handling of the car can be transformed.

13" Diameter

The standard car used 4" rims, for fast road use 5" is ideal, though wheels as large as 6" wide can be fitted, having carried out minor body modifications. When used purely for racing, the choice of width falls much more to the regulations of the class competed in.

Brakes

When fitting new harder linings it is essential that they are bedded in correctly for them to work efficiently and give the best results. Remember, some, but not all brake pads and linings are still made from asbestos, for personal safety do not use a brush or air line to remove brake dust, but instead use a vacuum cleaner or a damp cloth together with a can of brake cleaner. Make sure the dust or cloths are disposed of properly.

Brake Discs

Discs need bedding in on low speed gentle braking for about 10 miles, gradually raise the speeds, but maintain the gentle braking application. Then make 2 to 3 heavy braking applications where safe to do so, which should complete the bedding in.

Engine Preparation

When carrying out any engine rebuild, it is very important to use an accurate workshop manual,

this should be a genuine version as these tend to give the various model changes and the correct torque settings. When building any engine, the only correct way is to make sure that the area being used for assembly is clean, not to mention the components themselves prior to assembly, so that there is no chance of unwanted bits getting into the engine.

If you are not sure of the correct assembly procedure, follow the workshop manual closely. Full engine preparation will include some or all of the following modifications, depending on your own requirements. Here we show some formulae which are useful when modifying an engine:

Swept Volume = $\pi r^2 h = 3.142 \times (\frac{1}{2} \text{ Bore Diameter})^2 \times \text{Stroke}$.
(All dimensions should be in centimetres).

Cubic Capacity = Swept Volume x Number of Cylinders.
Compression Ratio = Swept Volume + Chamber Volume.
Chamber Volume = Where Chamber Volume includes Gasket, Piston (if Dished) and Amount of Deck Height as well.

Cylinder Block & Components

The block must be cleaned thoroughly before any machining work is carried out and again afterwards. The cleaning should cover the oilways and waterways to make sure that the fluids will flow correctly.

Oilways

The cleaning of the oilways will require the removal of the screwed plugs in the engine block and when re-assembling use a suitable thread sealant. The machining left-overs or fazes, need to be removed whilst this work is carried out.

Waterways

Make sure that all deposits are removed to ensure adequate water flow, this is essential if larger capacity is being used.

Cylinder Bores

When carrying out re-boring work make sure that the piston supplier's recommendations are complied with.

Thrust Washers

These normally can be doweled into position once the required size has been found. This ensures that the washers cannot revolve or move during arduous applications.

Main Bearing Caps

The standard cap does not normally require any change although the 'smoothing' of the surface will tend to strengthen the unit. Polish, smooth and shot-peen the caps to relieve surface stress and reshape to give a uniform cross section. For hard road/racing use, fit 1/4" longer high tensile bolts to the centre main cap and bottom-tap the holes to ensure they do not bottom-out. Remove the top three threads from the centre main by counter boring to put the load deeper into block. Remove all excess flashings from inside the cylinder block but **DO NOT** grind any machined areas. It is possible - especially for racing use, to increase the oil supply to the centre main as this in turn supplies the con-rods.

Drill out the feed hole to 5/16", entry is made from oil gallery end. Ensure all oil ways are clear not only of deposits, but also of excess swarf from production machining.

Oil Pump

Always use a new oil pump and preferably improve it's capacity - especially for competition work, by carrying out the following:

- Reduce the end float of the spindle/base plate, this will then restrict pressure loss.
- Make sure that the rotor clearances are as small as possible, as again this will improve the pumps performance.
- Always check that the rotor edges are smooth to reduce the chances of them picking up on the top or bottom plates.
- Check that the new pump outlet aligns with the cylinder block inlet aperture, amend as necessary.

Oil Pressure Relief Valve

The valve itself is recommended to be seated into the block, so that the oil will not leak past easily. The pressure spring can be increased to improve the overall oil pressure, especially when an oil cooler is being used. If the TriumphTune uprated spring is fitted to 1500 units, make sure that there are no extra washers also installed.

Crankshaft

If you are re-using your old crankshaft it is recommended for the oilways to be cleaned out properly - a pipe cleaner is very good for this. If the plugs are removed use a thread sealant when refitting. Tuftride hardening of the crankshaft is highly recommended to improve the life of the unit at a

reasonable cost, this can be for road or competition use. When Tuftriding is carried out, the crankshaft must then be re-machined or polished back to the correct journal size. Normally the journals are micro polished to give a good oil surface.

Flywheel

Lightening of the flywheel to reduce the rotating weight will enable the engine to pick up and rev easier which is highly recommended for all fast road cars. This work is usually carried out to your own unit at the same time as balancing. The amount of weight saving will depend on the actual flywheel design.

Con Rods

When rebuilding an engine always use new con rod bolts, replace the little end bushes and ream to size. For normal use, the standard con-rods are maintained, although they can be lightened to improve the strength as illustrated. Unfortunately, the cost of us carrying out this modification is prohibitive as a service because of the labour time required.

- Check the rod for twist and bend defects, and also the big end for an out-of-round condition, replace any that are faulty.
- Check the overall length to make sure they are all equal.
- Check the little end bushes and replace, line bore to size.

Pistons

For racing use, there are a number of different sizes on some models, which require special treatment of the block and clearances, check carefully before re-boring. Pistons can be radiused on the lower edges to assist in reducing bore problems, also the whole unit can be polished after ensuring that the heights have been equalised.

Piston Rings

Before final installation check that the width of ring is correct for your piston. Modify the ring ends after the gaps have been set, so that the edges do not dig into the bores.

Oil Seals

The standard oil seals, front and rear, should be replaced at any rebuild. The rear unit should be centralised carefully to stop oil leaks at high engine speeds.

Push Rods

The standard push rod is adequate for road use, however, we would recommend using performance type push rods for sprint/racing. Also essential if using roller rockers.

Cam Followers

When changing the camshaft, you must fit new cam followers, otherwise your new camshaft will not last very long. The amount of weight that the camshaft has to lift each time restricts the revving capabilities of the engine, therefore the use of the lighter cam follower is recommended. The lighter variety will also reduce loading on the camshaft lobes for extended life.

Timing Chain and Gears - Crankshaft and Camshaft

If a performance camshaft profile is being used, we recommend that you fit the Duplex timing chain and gear set.

Vernier Cam Gear

This adjustable cam gear allows easier correct timing of the camshaft for maximum performance. Only available as a duplex gear, the gear is made in two halves, which allows the adjustment to be made to suit your particular camshaft requirements.

Tensioner

The standard tensioner needs to be replaced if a new chain or gear set is being fitted.

Sump

For a road car it is not essential to carry out any changes, but for competition use the sump must be baffled to stop the oil surging away from the oil pump when cornering. Details as per the diagrams, if the capacity is increased, then extend the oil pickup pipe to suit.

General Rocker Gear

For a road car the standard rocker gear only requires minor alterations. For competition use or maximum power then the use of the roller rockers will be a major benefit.

By reducing the weight of the moving components in the rocker gear, followers, valves, caps etc... and also the resistance of the rockers, the rev range can be improved without increasing the loading on the camshaft.

Bronze Valve Guides

Our bronze alloy valve guides are for improved reliability and longer life, especially when being used under duress. Highly recommended for all heads and especially for any competition engine. Specially shortened and reshaped for improved flow.

Valve Springs

It is essential to check the springs for coil binding or being solid at maximum lift. Our valve springs are specially made for our high-lift cams. Note: On 1500cc engines remove lower spring collars if TriumphTune springs are used, as they are no longer required.

Alloy Valve Spring Caps

Standard caps are adequate in strength for all applications, but our light alloy caps reduce valve loading and therefore wear on cam lobes. Weight saving is approximately 25%.

Rocker Arm Action

The rocker arm is designed to move across the valve tip in a wiping motion, this leaves a witness mark on the stem top. To be certain your engine geometry is correct, remove the rocker arm and apply some Engineers Blue to the valve tip and rotate the engine through one revolution with the rockers correctly adjusted and the engine in its final specification. Remove the rockers and the valve tip will show the offset of the rocker geometry.

Centre

This is correct equally offset, so no excessive wear on either side of the guide will be found.

Manifold Side

If the mark is predominantly on this side, then the push rods and/or the pedestals must be shortened to correct this. With the wear on this side there will be excessive loading on the valve guide that will cause premature failure.

Rocker Side

On 1500cc engines, if it is to this side slightly, then this is no problem. But, if it is a long way off, then you can fit a pedestal spacer shim, TT1910 to compensate.

Alternatively use TriumphTune shortened push rods.

Pedestal Shim - TT1910.

Note: Do Not use lower spring collars with the inner springs when fitting TriumphTune valve springs.

Rocker Pedestal Shims - TT1910

These are available at a set depth to allow for a nominal skim of the cylinder head. The shim is specially designed to allow for the oil supply to the rear rocker pedestal.

Rocker Arm Lightening

For race engines, these can be reshaped as illustrated to improve the strength and reduce the weight. As this work is very labour intensive we would suggest that you carry out these alterations yourself.

Remove the shaded areas to lighten standard rockers, it's also useful to polish them.

Rocker Shaft

Although the standard rocker shaft is strong enough for most applications, the Tuftride hardening

process will provide improved reliability as well as being more resistant to wear.

Before installation clear the internal bore of any residual material and install new end plugs. Before fitting any shaft check that the end-plugs are in position, otherwise the shaft will not last long.

Rocker Arm Spacers

These spacers replace the side tension springs and allow the rocker arms to rotate easier, thereby reducing the loading, whilst also keeping the arms more centrally in position.

Roller Rocker Conversion

This specially manufactured assembly is designed to operate valves with less resistance and with more efficiency. The power increase with the use of these rockers is approximately an extra 10 bhp, and the power band can also be extended. We have found it preferable to maintain 108 > 110° peak to peak centres on cam profiles.

The steel rockers are made with needle roller inserts and have solid spacers already fitted. The end roller tips are specially made in high quality steel for long life. The Roller rockers are also designed to give a higher lift ratio of 1.65:1 against the standard of 1.5:1. The design is also specially strengthened so as not to deflect at any time through the operating sequence.

This conversion requires the use of the high pressure external rocker oil feed kit. When fitting this conversion it is essential for the valve lift to be checked carefully, to ensure that there is at least a total of 0.040" clearance between the valve spring coils, at full lift.

1. On installation Check Maximum Valve Lift to ensure adequate clearance of valve springs.
2. Before starting the engine, the clearance of the rocker cover must also be checked.
3. Check the push-rods for flexing and replace with tubular type if necessary.

1275cc Models

Cylinder Block

Cylinder block modifications nearly all take form of normal engineering practices, the only exception being the work required to fit a longer throw crankshaft. Steel strengthening straps for the main bearings can be very worthwhile in an engine rebuild if it is envisaged that the unit will be used to the limit. It is suggested that all main studs and bolt threads should be bottom tapped, for the head studs, the top threads should be slightly countersunk to ensure that the head is secured flat to the block and all loads are spread through the block.

If an increase in the engine's capacity is sought, ensure that all of the new components are compatible with each other and specifically designed for the new capacity, this is especially important when matching the cylinder head and pistons.

Carbon Fibre Push Rods

When installing these push rods, it is of the utmost importance to ensure that the rods do not rub or touch the side of the cylinder head or block during the engine's rotation. Due to the production variations in the block castings, it is recommended that all the push rod apertures are elongated by at least one millimetre at right angles to the rocker shaft. Then, with the camshaft and rocker gear in position, ensure that full clearance has been obtained. It is advised that all the push rods are painted up to the end caps in a light colour, then installed dry with zero tappet clearances.

Rotate the engine by hand a number of times, without the spark plugs fitted, then check the push rods individually for abrasions in the paint. If any are marked, ensure that the offending block material is removed, then re-check. Having cleaned the paint from the rods, they are then ready for final assembly. It is possible to go through the process described above and only open up those apertures that need modifying, but it is safer to assume that all holes will need to be opened out. Also remember if a camshaft profile is subsequently changed or high lift rockers are installed, the clearance checking will have to be repeated.

Cylinder Head

The compression ratio is best kept to 9.65:1 for fast road use, a slightly lower ratio may be necessary if 99 octane fuel is not available. If using larger exhaust valves, it is recommended that the exhaust guides are slightly offset to reduce the heat in the hot spot area between the valve seats.

For road use, larger inlet valves will give better performance and a wider power range than that of the stage 2 head with standard valves. Bronze alloy valve guides are always recommended for improved reliability. Valve spring rates depend on the camshaft and rocker ratio being used, for a road car using up to 1.5:1 ratio rockers, uprated springs are normally more than adequate. Competition springs are only required if higher lifts are used.

If the copper, AHT188 head gasket is used, remember that it should be soaked in water before fitting. The joint surfaces of both head and block must be checked for distortion and finely surface ground if necessary, using engineer's marking blue for final checking. The tops of the cylinder head stud threaded holes in the block may be slightly countersunk, helping the head to pull down around the studs more effectively. Improved flanged head nuts, 53K1193B help further by guaranteeing the clamping pressure on the head. Finally, competition head studs may be fitted if an increase in the torque setting is required, these studs may be tightened to 55lbs ft.

Camshaft

There are three types of oil pump drive and subsequently three oil pumps for the A Series engines:

Pin	Using a small slot in the rear of the cam, fitted originally to 948/1098cc engines.
Star	Fitted in all 1275cc Sprite and Midget engines as standard.
Metro	Using a slot drive cam, never originally fitted to Sprites or Midgets.

The standard oil pump is perfectly suitable, although the late Metro Turbo unit, CAM6614 has a substantially increased capacity and can be fitted if the camshaft is changed at the same time. The range of profiles available for this engine is seemingly infinite and comes from many suppliers around the world. Moss has chosen several which have proved to be competitive in terms of both performance and reliability, with profile working ranges producing a derivable car in road use, which is where most uprated engines will operate. For full race applications, special profiles are made on blank camshafts which offer much better power and range than re-profiled units.

Rocker Gear

The easy way of increasing performance on the 1275cc engine, once the head has been flowed, is to use high lift rocker gear which may be fitted easily as a 'bolt on' component. There are two versions, both at a ratio of 1.5:1, either with or without needle roller bearings, the former being recommended more for competition purposes.

High lift rockers maintain the opening and closing details of the camshaft profile, but will open the valve further to improve breathing, this is especially effective when used with a flowed head and improved carburation. Solid spacers ensure accurate alignment of the rocker arms and valves, while strengthened rocker pedestals are essential if a standard rocker shaft is used with stronger valve springs.

Timing Chain

The standard chain may either be single or duplex, whenever a performance camshaft is fitted, a duplex chain must be used, preferably with a vernier adjustable cam gear, which makes correct and accurate installation of a performance camshaft much easier. The camshaft timing belt conversion kit will make the engine much quieter as well as reducing the power loss suffered when using a duplex chain. The timing belt must be checked religiously every 10,000 miles and replaced at 20,000 miles.

Sprite & Midget 1275cc - Weber DCOE Jet Settings

	40 DCOE Road	40 DCOE Fast Road	45 DCOE Race

Idle Jet	40F8	50F8	50F6

1500cc Models

Cylinder Head & Components

On all Sprite & Midget engines, the cylinder head must be gas flowed properly to maximize the performance and efficiency from the engine. Work on the cylinder head centres around making the best diameter of the inlet port to suit and give maximum power potential. We have found that increasing the size of the Inlet Valve to 1.475" and very careful flowing of chamber/valve throat area will produce good torque and allow top-end breathing for sprint/racing use. The increase in exhaust valve size improves the flow of the port for maximum power.

The cylinder head modifications have been designed using a flow-rig to obtain the maximum from the head casting. Valve springs fitted to all our cylinder heads are the best uprated road specification. They are designed to allow the maximum lift from our performance camshaft profiles without excessive loads on the cam-lobes.

Spring retainers must be checked - especially the two part version for cracks. Alloy types are available to save weight, whilst still being strong enough for all applications. Valves, these are recommended to be gas flowed in the slim design, as this will improve the efficiency of the modified cylinder head substantially.

Rocker Gear - General

For a road car the standard rocker gear only requires minor alterations. For competition use or maximum power then the use of the roller rockers will be a major benefit. By reducing the weight of the moving components in the rocker gear, followers, valves, caps etc. and also the resistance of the rockers, the rev range can be improved without increasing the loading on the camshaft.

Rocker Arms

Standard rockers can be lightened, combined with the use of the spacer set they will reduce the loading on camshaft lobes, which will help to increase the rev range. Standard rocker pedestals do not need modification.

Baffled Sump

Though not essential, the sump may be baffled. Consistent oil pick up is then possible, even under hard cornering. For fast road use, a single vertical plate in the sump will suffice. For race use, increase the depth by 1" using the illustrations, on page 112 as a guide.

Choke Settings For Weber DCOE & Dellorto DHLA

45 DCOE or DHLA carburettors can be used on a racing 1500cc, there will be some loss of low speed torque from a twin carburettor arrangement, but not when using a single unit. The 40 DCOE/DHLA is recommended for most applications, set up to the following specifications:

1. 28mm Chokes for mild modification and road Use.
2. 30mm Chokes for fast road.
3. 33mm Chokes are used for maximum power*.
(*1500cc models using a sprint 83 camshaft and modified heads will only gain about 5 bhp at 5000 rpm).

Jet Settings For Weber DCOE & Dellorto DHLA

The settings given below are merely suggestions to be used as a starting point when setting up a car, it is very likely that there will be further adjustments necessary to get the carburation absolutely correct for the customer's requirements. These adjustments can only be carried out accurately by putting the car on a rolling road.

Sprite & Midget 1500cc - Weber DCOE & Dellorto DHLA Jet Settings

	40 DCOE Road	40 DCOE Fast Road	45 DCOE Sprint/Race	45 DCOE Single
Choke	28	30	33	33
Auxiliary Venturi	4.5	4.5	4.5	4.5
Main Jet	115	115	125	190
Emulsion Tube	F16	F16	F16	F9
Air Jet	165	155	165	175
Pump	35	35	35	40
Idle Jet	45F8	45F8	45F9	45F9
Back Bleed	0	0	N/A	0

1500cc Gearbox

The Midget 1500cc uses slightly higher ratios in its gearbox than the mechanically similar Triumph Spitfire 1500cc. The different gearbox ratios are as follows:

	1st	2nd	3rd	4th
Spitfire 1500cc	3.5	2.16	1.39	1
Midget 1500cc	3.41	2.11	1.43	1

5 Speed Gearbox

See the Accessories section for our 5 speed gearbox conversion for Midget 1500cc models.

Midget (& Spitfire) 1500cc Engine

There are 2 ways of looking at the 1500cc (1493cc) engine used in the last of the Midgets and Spitfires. You can justifiably regard it as the last gasp of an ancient saloon car design from the early 50's that produces a mediocre 71 bhp at 5500rpm, looks totally uninspiring and sounds the same.

More positively you can consider it a very well, and proven design that's long since had the bugs ironed out, has remarkably few weaknesses that can be safely and easily tuned to give the sort of output that one expects from a modern 1500cc engine.

"Did you know that the Triumph 1500cc engine can trace its roots back to 1953 and the Standard 8, yet it has surprising tuning potential."

A casual glance at the engine specification is a little misleading, its bore and stroke of 73.7mm x 87.5mm suggests a slogging old fashioned long-stroke design but in fact the long stroke was introduced in 1974 when the engine received its ultimate stretch, from 1296cc to 1493cc. By that stage the block had long since reached its limit for bore size and, the only way to get the extra displacement needed to overcome the power sapping US emissions control equipment, was to lengthen the stroke.

Regardless of how the long stroke came about - it is there, and engine tuning has to be approached accordingly. With the 1500cc unit, 6000 rpm is a far more realistic ceiling, but even within that modest rev limit the one fundamental problem is the oil system.

Even moderately hard use sends the oil temperature soaring past 100 degrees centigrade - excessively thinning the oil and dropping the oil pressure to the point where bearings will suffer. These engines were certainly NOT designed for motorway use and sustained high speeds.

It may sound odd, but the very first requirement is an engine oil cooler - but believe us, that's the way it is. In contrast, there is no problem with water cooling and, the standard water pump and radiator are perfectly adequate. The oil cooler is required even in temperate, cold Britain, with the proviso that it really should be thermostatically controlled, allowing the engine to warm up quickly to its correct operating temperature, which also avoids bearing wear. With an oil cooler in place the oil pressure should, all things being equal, always be adequate, but, to be on the safe side you can increase the oil pressure slightly by fitting an uprated Oil Pressure Relief Valve Spring.

Note: Terry Hurrell's famous Spitfire 1500cc used to run a pressure of 90psi when cold, dropping to 60psi when hot, and, really, that's as much as you need.

Fitting an oil cooler is a simple enough operation, our thermostatically controlled oil cooler radiators mount below the water radiator and the pipe housing (that holds the thermostat) spins on to the oil filter mounting, the oil filter in turn screws on to the new housing.

Curiosity will, if nothing else, lead you to want monitor the oil temperature - good job we have included them in the Interior part of the Accessories section. We offer a dual oil/water temperature gauge and, a dedicated oil temperature gauge.

The other important modification that should be made to the 1500cc engine oil flow system, especially to the cylinder head, which was marginal when the engine was new, is to fit our Oil Rocker Feed kit, part number TT1226. This kit, with its Stainless Steel braided hose supplies much needed oil directly to the rocker assembly and minimises wear and damage. The adaptor fits neatly in-line with the oil pressure switch, and the banjo connects to an existing hole in the rear of the cylinder head.

Attention to the oil system should protect the bearings, and here the 1500cc has one advantage over its Triumph 1300cc predecessor, when the engine was re-stroked to 1493cc the width of the main bearings was increased (in round terms) from 2" to 2.3". That should allay any fears about the bottom end.

Despite the bad press three-bearing crank's have suffered, this one is not prone to flexing or undue vibration, so attention can now be switched to where it's needed - which is the engines breathing - both to getting the air/fuel mixture in and, the gasses out. A glance at the standard four-into-one cast-iron manifold suggests that it wasn't designed with performance in mind! So, the first stage of tuning is to discard it and fit a sports extractor manifold coupled to a Sports Exhaust System.

Terry Hurrell found that just by fitting a sports manifold and exhaust system to his Spitfire 1500cc, and by fitting richer carb needles, such as AAQ's in conjunction with Yellow carb damper springs and K&N sports air filters, that an increase of 15bhp could be achieved. An increase of 15bhp from 71 is significant, and shows the potential. With any tuning however, you should bear in mind the laws of diminishing returns, the first stages of tuning are often easy and economical, but the further you go the more you spend for smaller increases.

The exhaust modification is bolt-on, now you have to tackle the cylinder head.

The original design of the combustion chambers is a classic bath-tub shape, simply a matter of accommodating two valves side by side with space for the spark plug in the middle to one side. Port design is similarly unsophisticated.

With the development of the 8 port head in 1964 by the Triumph engineers, the flow to the combustion chambers was improved significantly leaving the initial tuning focus on the valves and their immediate area. The standard inlet valves are comparatively small at 1.38" (33mm to 35mm) for a 1500cc engine. The exhaust valves at 1.17" (29mm), are more than adequate unless you are aiming to achieve 110bhp+ by fitting a stage 4 head.

To begin with, valve shape is more fundamental than size. The standard valves are very strong with thick stems that gently broaden out to a thick base with deep seats - a true mass production item with mass production tolerances, in other words, margin for error.

Our TriumphTune valves are cut-away at the stem to allow better gas flow, and the top of the valve is cut away, making the valve almost flat in cross-section. At the same time this makes the valves lighter, lessening the reciprocating weight in the valve train thus making higher rpm easier. For the same reason you can fit lighter cam followers and Alloy valve spring caps (retainers).

Inlet valve design is more crucial than exhaust, as ideally the inlet should flow approximately 40% more. That also accounts for the chamfering of the inlet valve guide where it enters the inlet port. Exhaust valve guides could be similarly shaped but that is only necessary for full race engines.

In theory, TriumphTune heads do not overcome the problem of valve shrouding - steep sides to the combustion chamber, with the valves taken out as close as possible to the chamber wall, often slows the fuel mixture a little entering the chamber. However, according to Terry Hurrell, this is not a problem once the head has been flowed. As for the ports, the major work centres on removing the metal around the valve guide - which is a high-flow area, and opening out the port where it turns down to the combustion chamber, as the mixture flow is normally restricted where it changes course.

The stages of combustion chamber & valve modification are quite logical.

Stage 1 is a general tidying up of the gas flow. Stage 2 follows on when the standard valves are reshaped along with the ports and chambers. Stage 3 also sees the standard (larger 1.38") inlet valve replaced with 1.475" valves. It is only at 'Stage 4' that the larger standard 1500cc exhaust valves (1.17") are replaced 1.25" valves, and, when you get to this stage further re-working of the exhaust side of the head is carried out.

Some engines can be transformed with only a camshaft change - the 1500cc engine is not one of them, and the full benefits of more radical cams can only be reaped after the cylinder head has been tuned. For any but the mildest new cam, the approach should be to take the cylinder head to stage 3, ie: gas flowed with larger inlet valves and uprated valve springs with alloy valve caps.

Valve timing of the standard 1500cc camshaft is a mild 18-85, 58-18. Clearly biasing it to torque rather than high rpm power. To take the fast road 83 cam as an example, that should give 105 to 110bhp at 5500rpm. There's a penalty of a lack of low speed torque but an obvious gain in power above 2700rpm. Such a camshaft could still be used with the 11/2" SU's with suitable needles and springs, not to mention replacing the Waxstat jets and fitting Grose jets, but Dellorto or Weber's would be better.

One thing with such an exercise is it assumes that the engine is in a sound enough state to stand or benefit from the tuning. Regrinding the crankshaft and the fitting of new shell bearings would obviously add to the cost, while a re-bore with new pistons would cost even more. If you are going to stay with the standard pistons, the very least you should do is a compression test. Acceptable figures would be around 140psi, assuming of course that you are not losing compression through poor valve seating!

We recommend using 3-ring pistons if you are building an engine to fast road/sprint (or beyond) specification. Hepolite Powermax used to be the easiest option when they were available, but you can use TR6 pistons if you are prepared to machine both the piston and the block.

The state of your engine may well depend on whether its in, or came from a Spitfire or a Midget. The problematical oil cooling is made worse by the Midgets cramped engine bay and, its final drive ratio is significantly lower, so that at any given road speed the Midgets engine is spinning faster. That combination can lead to a tired old engine in as little as 40,000 miles, while the Spitfire version will soldier on for some 70,000 miles or so - all things again, being equal.

Whatever the mileage however and, to be on the safe side, you should be prepared to strip the engine down completely to check that all is as it should be, before embarking on any performance tuning.

Finally, I know we keep saying this, but please do make sure that your brakes, suspension, steering, chassis etc can cope with the modifications.

Production & Development History

Sprite MkI (AN5 model)

The relationship built up between the British Motor Corporation (BMC) and motor sport celebrity Donald Healey in the 1950's resulted in the creation of the Austin Healey 100 sports car, a vehicle which enjoyed considerable sales success, particularly in the important North American market. A potential market for a smaller 'budget' alternative was soon identified, and this led to an 'informal decision' between BMC's chairman, Leonard Lord, and Donald Healey to develop a small sports car based on Austin parts, mostly centred around the Austin A35 saloon car.

The engine, transmission, rear axle and front suspension were all to be used, but steering would come from the Morris Minor and better, hydraulically operated, brakes were needed. MG derived manifolds and twin 1 1/8" carburettors would boost power. The engine was developed by Morris engines, and they later supplied the units since Austin's engine department was at the time overrun with work. The new car, eventually named the Austin Healey Sprite, was to do away with a separate chassis and bodyshell. Instead, it was designed around a monocoque frame consisting of front and rear bulkheads, joined by 'top hat' sill sections and body stiffeners, all mounted onto a floorpan. Extra rigidity came from the central gearbox tunnel. In many places, the body utilised flat panels and simple formed sections to keep construction costs down to a minimum. The bonnet and front wings hinged upwards as one assembly from the bulkhead, and the upwards curve of the front top edge of the sill panels accentuated this feature. This characteristic sill line was to last until the end of production of the last descendant of the Sprite family tree, the MG Midget 1500cc, twenty one years later. The first prototype Sprite incorporated external hinges to reduce costs, but expensive pop-up headlamps. By prototype number two, the headlamps had become fixed providing the 'frog-eye' appearance so well known and loved today. The little Sprite, built in the MG factory in Abingdon, was launched in 1958. It was a hoot to drive, if somewhat cramped inside (another feature which would see out production twenty one years later). It quickly established itself in the motoring world, aided by a low price of £455 (less Purchase Tax) and a successful motor sport career in the hands of BMC works team drivers, most particularly John Sprinzel.

Sprite MkII & Midget MkI

(H-AN6 and G-AN1 models)

For 1961 it was decreed that something of a revamp was necessary, and to this end the Austin Healey Sprite MkII was launched, together with a new, slightly more lavishly finished stable mate, the MG Midget. These two models offered a radically altered, more square body profile wrapped around essentially the same under-frame. The rear of the body now had a boot lid for the first time, while at the front out went the charismatic (or ugly, if you prefer) frog-eye look, to be replaced with the conventional set up of separate wings housing the headlamps. Between the wings a narrower, and certainly lighter, bonnet panel gave rather poorer access to the engine bay. The little 948cc engine became more willing, thanks to the fitment of 1 1/4" carburettors and improved cam timing. Steering, suspension and brakes remained largely unaltered.

Sprite MkII 1100 & Midget MkI 1100

(H-AN7 and G-AN2 models)

The next milestone was the introduction of a 1098cc variant of the trusty BMC 'A' Series engine in 1963. Along with the improved performance, the brakes were uprated with front disc brakes appearing for the first time in production on the cars - prior to this, a disc brake conversion kit had been independently marketed by the Healey Motor Company of Warwick. Otherwise virtually unchanged, the new models were known simply as the Sprite MkII 1100 and Midget 1100; they are now often colloquially referred to as the 'Mk 2 1/2' and 'Mk 1 1/2' respectively.

Sprite MkIII & Midget MkII

(H-AN8 and G-AN3 models)

Many aspects of the design were changed at the next revamp, which occurred in 1964. The body of the Sprite MkIII and Midget MkII, largely unchanged in silhouette, received an all new dash layout, fitted carpets in all models, a new windscreen with easier to fit hood attachments, plus wind up windows to replace the sidescreens. These were all improvements inspired by the marketplace (America in particular), which was beginning to lean towards more comfortable cars. For the same reasons, the beautifully handling - but harsh riding, rear suspension lost its quarter elliptic springs, gaining instead a more conventional semi-elliptical spring layout which lost a little of the accuracy and sharpness but improved the ride enormously. A benefit not seen at the time, but in the cars' old age now greatly appreciated, is the fact that the new suspension did not impose so much stress on the monocoque body, with the result that split seams, cracks and corrosion around the rear floor and bulkhead were (and are) on the whole, much less common on post 1964 cars. In answer to misgivings about the bottom end durability of the engine, larger main bearings were fitted. A larger

clutch and strengthened ('Ribbed Case' as opposed to the previous 'Smooth Case') gearbox was also introduced, keeping the model range in line with the other BMC products using that basic type of gearbox, the Morris Minor, Austin A40 and A35 van.

Sprite MkIV & Midget MkIII

(H-AN9 and G-AN4 models)

By 1966, Sprite and Midget performance figures were beginning to look a little feeble when compared with contemporary saloon cars - not an ideal situation for a sports car to be in. Indeed, the immensely popular Mini Cooper 'S', which was also a product of BMC, was taking the limelight and eating into potential sales. In an effort to counter this, a slightly de-tuned version (apparently for reliability's sake) of the 1275cc Cooper 'S' engine was fitted to the Sprite MkIV and Midget MkIII from October 1966. Along with the improved performance, the new models also benefited from a new, convenient, fold down hood design. It was at this time that cars for North America began to seriously deviate in their specification from those built for markets in the rest of the world, due to increasingly stringent safety and emissions regulations there. Also during this period, Midgets bound for Australasia were built there from completely knocked down (CKD) kits supplied from England.

Sprite MkIV & Midget MkIII

(H-AN10/A-AN10 and G-AN5 models)

'Leylandised' versions of the cars arrived for the 1970 model year, in fact some eighteen months after MG, Austin and their parent companies had become part of the massive British Leyland Motor Corporation. The nomenclature - Sprite MkIV and Midget MkIII - remained the same as before, as did the mechanical and sheet metal specifications. However, the car now had a much more upbeat contemporary appearance, due to a myriad of trim changes both outside and in.

Gone was the 1960's style bright-work. A new radiator grille (effectively a blacked out and jazzed up version of the previous Sprite grille) was complemented by slim-line bumpers, fashionably quartered at the rear. Completing the slim-line effect, the sills were also painted satin black, giving the car a sleeker side profile. New spoked steel wheels ('Rostyles') aesthetically matched the car as well as the optional, more traditional, wire wheels, demand for which began to fade. Inside the car, heat welded vinyl abounded, instead of stitched pleat upholstery; this style of interior trim was to remain with the vehicle up to the end of production.

Towards the end of 1971, the Sprite disappeared quietly from the new car showrooms. Sales had slowly slipped away and had latterly been confined to the home market. The last 1022 Sprites were simply badged as 'Austin', since the agreement between Leyland and Healey had lapsed.

The Midget MkIII, however, remained comfortably in production, seeing in 1972 with new rear wings with the square topped wheel arches replaced by round ones (not seen on Sprites and Midgets since the 'Frogeye'). As a result it became easier to fit fatter tyres and alloy wheels, which were popular aftermarket accessories at the time. If the urge to fit them was resisted, the car would definitely be sitting on radial ply tyres: they became standard equipment alongside a much needed alternator (which replaced the by then archaic dynamo). As a sop to forthcoming home market safety regulations rocker switches found their way onto the dashboard, replacing the more satisfying but apparently less safe toggle switches. By 1974, Midget sales in mainland Europe had ceased, basically leaving Britain, the USA, Canada and Japan taking the car.

Midget 1500cc

(G-AN6 model)

As an attempt to rationalise on the build specification, many of the safety and emissions changes necessary for the 1975 North American specification models were also implemented on home market vehicles. These included the well known 'rubber' bumpers (actually plastic), a ride height increase of one inch to meet bumper height regulations, a return to square rear wheel arches and a whole new power train.

As North American emission control equipment had progressively strangled the 1275cc engine, the performance maintaining solution was to replace it with the engine out of its closest rival - the Triumph Spitfire. The Spitfire engine had already had its capacity enlarged from 1296 to 1491cc for the same emission related reasons, while the old BMC 'A' Series unit could not reliably be taken any larger than its current 1275cc. As a result, the entire Triumph engine and gearbox assembly, with only a couple of detail changes, was fitted into the Midget engine bay. This car became known as the Midget 1500cc, although it was still a Midget MkIII officially (and in most respects under the skin was very similar to the outgoing 1275cc engined MkIII).

While it certainly lacked the keener, sportier edge of the earlier cars, it was undeniably a better cruising vehicle (though sadly it never benefited from the overdrive which was optional on the same gearbox when fitted in a Spitfire).

Sprite & Midget production finally finished in 1979, when the last Midget 1500cc's rolled off the line. Ironically, amongst the last cars built were five hundred special black models, celebrating fifty years of MG Midget production. In total, 355,888 Sprites and Midgets were built between 1958 and 1979.

Location Of Unit Numbers

Chassis Number (All Models)
The chassis number is stamped on a plate secured to the support step on the LH inner wheel arch under the bonnet.

Body Number (All Models)
The Body Number is stamped on a plate secured to the LH front door pillar.

Engine Number (1275cc)
The Engine Number is stamped on a plate that is secured to the RH side of the cylinder block.

Engine Number (1500cc)
The Engine Number is stamped on a flange on the LH side of the cylinder block.

Car Identification

Model Years

A model year does not necessarily coincide with the year in which the car was built. For example, it may be seen from the following chart that while a car built in January 1972 is indeed a 1972 model year car, another one built in August of that year is a 1973 model year car. There are several different reasons for this. One reason is that it is easier to bring in changes in a model's specification when production has been halted already for a holiday shut down. Another reason is that motor shows usually took place in the Autumn and Winter, displaying the following year's new or updated models. Detailed here are the Sprite and Midget model years relevant to this catalogue.

Model	Model Year	First chassis no.	Start Date
MG Midget MkIII	1967	G-AN4-52390	October 1966
Austin Healey Sprite MkIV	1967	H-AN9-64735	October 1966
MG Midget MkIII	1968	G-AN4-60460	November 1967
Austin Healey Sprite MkIV	1968	H-AN9-72041	November 1967
MG Midget MkIII	1969	G-AN4-66226	December 1968
Austin Healey Sprite MkIV	1969	H-AN9-77591	December 1968
MG Midget MkIII	1970	G-AN5-74886	September 1969
Austin Healey Sprite MkIV	1970	H-AN10-85287	September 1969
MG Midget MkIII	1971	G-AN5-96273	December 1970
Austin Healey Sprite MkIV	1971	H-AN10-86766	December 1970
Austin Sprite MkIV	1971	A-AN10-86803	January 1971
MG Midget MkIII	1972	G-AN5-105501	October 1971
MG Midget MkIII	1973	G-AN5-123731	July 1972
MG Midget MkIII	1974	G-AN5-138801	August 1973
MG Midget 1500cc	1975	G-AN6-154101	September 1974
MG Midget 1500cc	1976	G-AN6-166301	October 1975
MG Midget 1500cc	1977	G-AN6-182001	August 1976
MG Midget 1500cc	1978	G-AN6-200001	August 1977
MG Midget 1500cc	1979	G-AN6-212001	May 1978
MG Midget 1500cc	1980	G-AN6-229001	October 1979

Serial Number Prefixes

Midget chassis numbers:	G-AN4	(1967 - 1969)
	G-AN5	(1970 - 1974)
	G-AN6	(1975 - 1979)
Sprite chassis numbers:	H-AN9	(1967 - 1969)
	H-AN10	(1970)
	A-AN10	(1971)
1275cc engine numbers:	12CC/Da/H	(1967)
	12CE/Da/H	(1968 - 1971)
	12V586F	(1972)
	12V588F	(1973)
	12V778F	(1974)
1500cc Engine numbers:	FP	(1975 - 1979)
Midget body numbers:	GBE	(throughout)
Sprite body numbers:	ABL	(throughout)

Please Note: These pages list only the major items in each area, such as body work, electrical and brake components. In many cases minor fittings, clamps and linkages etc. are not shown.

Engines & External Components 1275cc

Engine Unit Identification (1967-74)

For the 1967 model year, the Sprite & Midget were given the 1275cc version of Austin's 'A' series engine. On non USA Sprite MkIV's & Midget MkIII's, five different versions of the ubiquitous 'A' series were used, identified by their serial number prefixes (dates given as model years, approximately): 12CC (1967), 12CE (1968 - 71), 12V586F (1972), 12V588F (1973), 12V778F (1974).

If your car has a reconditioned or remanufactured engine, it may not display an engine number; in the case of a genuine factory replacement unit ('Gold Seal' or 'Silver Seal') the engine number plate will show the unit's part number (8G179, 8G180, RKM1108E or GSE1106E) rather than serial number. In any instance, a glance at your vehicle registration document will reveal the engine serial number appropriate for your car (and thus will give you a clue after studying these pages as to which oil filter assembly you have, etc.).

Full Engine Assemblies (1967-1974)

Our exchange engines are reconditioned and the cylinder heads are converted to lead free. They are supplied without water pump, front crank pulley or black plate. You will need to retain these from your old engine.

Note: A refundable surcharge will apply to all units unless the customers own unit is supplied to be reconditioned.

Ill.	Part Number	Price £ea.	Description	Req.	Details
1	RKM1126E	£1650.00	ENGINE, recon, exchange, standard	1	
	RKM1126ST2	£2750.00	ENGINE, recon, exchange, stage 2	1	

Note: See Accessories section for details of our 'stage 2' full engines and other tuning components.

RKM1108E	£1693.00	ENGINE, recon, exchange, standard	1	alternative

Engine Components & Gasket Sets (1967-1974)

ill.	Part Number	Price £ea.	Description	Req.	Details
2	AJM225	£37.30	CONVERSION GASKET SET	1	bottom end set
	AJM225Z	£13.50	CONVERSION GASKET SET, aftermarket	1	
3	AJM1140	£20.00	GASKET SET, top end	1	alternative
	AJM1140Z	£10.50	GASKET SET, top end	1	
5	AEC876	£1.50	CORE PLUG	5	Includes item 2 plus cylinder head core plugs
	GAC7202X	£3.30	CORE PLUG SET	1	
6	2K1345	£2.00	PLUG	2	oil pressure relief valve passage
7	12G3503	£2.70	PLUG, oil gallery	4	rear engine plate
8	1A1964	£2.54	RESTRICTOR, camshaft oil feed	1	
9	1G752	£0.82	DOWEL, lower	1	
10	12G422	£0.78	DOWEL, upper	1	
11	NCA		HARDWARE, main bearing cap		

Note: See Internal Engine on page 122.

12	CAM150	£4.20	STUD, cylinder head	4	long
13	CAM151	£3.00	STUD, cylinder head	5	short
14	51K1193	£1.00	NUT, cylinder head	9	standard (see item 15)
15	GHF302	£0.46	WASHER, plain	9	
16	51K1193B	£1.80	NUT, cylinder head, heavy duty	10	flanged, washer not required
20	CHS2515	£1.00	STUD, fuel pump drive aperture	2	
21	2A265	£4.06	BLANKING PLATE, fuel pump	1	
	2A265K	£6.50	BLANKING PLATE KIT, fuel pump (Includes blanking plate, gasket & hardware).	1	
22	2A113	£0.52	GASKET, blanking plate	1	12V778F units only
23	GHF201	£0.08	NUT	2	
24	GHF332	£0.20	WASHER, locking	2	
25	3H576	£18.00	DRAIN TAP, cooling system	1	
26	ARH517	£0.22	WASHER, drain tap*	a/r	

*Note: This washer not only seals the joint, but also (when used in multiples) shims out the distance between the tap body and the engine block, so that the spout of the tap will point vertically downwards when the tap is screwed tightly into the block).

27	53K2853	£6.00	PLUG, drain tap aperture	1	alternative to
28	6K638	£0.22	WASHER, copper	1	items 25 & 26
30	2K4994	£2.84	PLUG, (oil priming hole)	1	not required on
31	6K464B	£0.60	WASHER, copper	1	12V778F units
35	NCA		REAR COVER, crankcase	1	not supplied separately
36	AEG240B	£0.83	GASKET, rear cover	1	
37	GHF117	£0.20	SCREW, (rear cover to block)	3	
38	GHF331	£0.12	WASHER, locking	3

37	AEG428	£18.60	LINER, cylinder block	4	
45	AEG523E	NCA	CAMSHAFT, exchange	1	standard, see Accessories
46	KEN2	£7.62	CAMSHAFT LUBRICANT	a/r	250ml bottle
			(Statistics abound concerning the proportion of the total wear in a camshaft's life which actually occurs in the first few minutes of running the engine. A newly built engine needs as good a quality of lubrication as you can give it during those vital, first few thousand revolutions of its life. Camshaft lubricant, applied correctly during assembly, goes a long way towards preserving both your engine and your peace of mind).		
47	AHU2379	£10.90	LOCK PLATE, camshaft	1	
48	GHF117	£0.20	SCREW, lock plate to crankcase	3	
49	GHF321	£0.14	WASHER, shakeproof	3	
50	12G1397	£15.00	GEAR, camshaft, double row	1	
51	6K629	£2.84	NUT, camshaft gear	1	
52	2A759	£1.20	LOCK TAB, camshaft gear	1	
53	WKN505	£0.98	WOODRUFF KEY, camshaft	1	
54	2H4905	£5.50	TIMING CHAIN, 'Duplex'	1	
	2H4905Z	£4.00	TIMING CHAIN, 'Duplex', aftermarket	1	
	2H4905UR	£30.50	TIMING CHAIN, 'Duplex', high quality	1	
55	BHM1210	£15.95	BEARING SET, camshaft	1	
58	2A13	£2.60	CAM FOLLOWER, standard	8	
	2A13/10	NCA	CAM FOLLOWER, 0.010", (oversize)	8	
59	AEG314	£3.00	PUSH ROD	8	
60	CHM108	NCA	FLANGE, oil pump driving	1	
61	GLP141	£21.80	OIL PUMP*	1	

*Note: There are two different oil pumps for the 1275cc engine, confusingly under the same part number GLP141. The 'concentric' pump is fixed in place by four bolts, whereas the 'Hobourn Eaton' pump uses two bolts. On the four bolt pump, a pair of lock tabs are used under the bolt heads, the two bolt pump simply uses two locking washers.

Note: By the way, unless you are intending to replace it, don't dismantle your oil pump to inspect it. The

rubber 'O' ring which seals the pump casing expands through oil impregnation and upon disassembly of the pump will, as surely as night follows day, pop out of its groove. After a half an hour of your blood pressure rising and your hopes of achieving successful re-assembly falling just as rapidly, you'll probably phone your specialist to be told that the 'O' ring is not, (and was never) available as a service part.

62	GUG705560GM	£0.64	GASKET, oil pump to block	1	
63	BH604131	£0.80	BOLT, pump to block	4/2	see notes above
64	12G2098	£0.50	LOCK TAB, upper	1	
65	12G2097	£2.40	LOCK TAB, lower	1	four bolt fixing pump
66	GHF331	£0.12	WASHER, locking	2	two bolt fixing pump
67	12A451	£14.40	PIPE & BRACKET, oil pick up	1	
68	SH604041	£0.20	SCREW	4	
			(Strainer to bracket & bracket to block).		
69	GHF321	£0.14	WASHER, shakeproof	4	
70	2A668	NCA	STRAINER	1	
75	12G4499	£44.00	DISTRIBUTOR DRIVE	1	
76	13H2792	£1.10	'O' RING, distributor drive	1	
77	12A1136	NCA	DISTRIBUTOR HOUSING	1	
78	GHF117	£0.20	SCREW, distributor drive to block	1	
79	GHF321	£0.14	WASHER, shakeproof	1	

Cam Bearing Fitment

When new cam bearings are installed, their finished bore size should be checked prior to installing the camshaft. This will ensure that the cam rotates freely in its new bearing set. The replaceable cam bearings are a push fit into the cylinder block. There is no positive location method for them other than friction. To prevent any possibility of them migrating axially along the camshaft in service, it is recommended that they are installed using an engineering adhesive such as 'Loctite'. You will know if a cam bearing has moved along the length of the camshaft as it will invariably foul one of the cam followers, holding one of the valves open.

NI	GGL1020	£22.00	LOCTITE, 'Stud-Loc'	a/r	10 ml
NI	GGL1021	£5.60	LOCTITE, 'Stud-Loc'	a/r	3 ml
NI	KEN2	£7.62	CAMSHAFT LUBRICANT	a/r	250ml bottle

Flywheel Ring Gear Replacement

Flywheel ring gears are manufactured from a heat treated steel. Since the installation of a ring gear involves heating and expanding the item to subsequently 'shrink' it on to the flywheel, great care must be taken to preserve the heat treatment to maintain the wear resistance properties of the teeth.

The flywheel ring gear may be removed and fitted in the following manner:

Removal

Take note of whether the chamfers on the old ring gear teeth are on the engine or gearbox side of the flywheel, the replacement ring must be fitted in this manner.

- With the flywheel assembly removed from the engine secure it in a vice fitted with jaw protectors. Drill a 3/16" diameter hole axially between the root of any tooth and the inner diameter of the starter ring. Care should be taken to prevent the drill entering the flywheel.
- Place a cold chisel in the tooth root immediately above the drilled hole and strike it sharply. Note: The starter ring will normally split harmlessly, but on remote occasions rings have been known to fly when severed. It is important that adequate protection, particularly for the eyes, be utilised. The whole assembly should be covered with a cloth to restrain and prevent injury from flying fragments.

Refitting

- Before attempting to fit the new starter ring gear to the flywheel, ensure that any 'nicks or burrs' have been removed from the mating surfaces. Remember, 'nicks & burrs' are the enemy of the engineer!
- Heat the replacement starter ring gear uniformly to a maximum of 200°C (392°F). Exceeding this will draw the metal's 'temper'. Note: The temperature to which the ring gear is heated (if using oxyacetylene equipment or similar) can be checked with the use of a thermo-melt crayon, available from specialist tool suppliers. Alternatively, putting the ring gear in a domestic oven set to the correct temperature should guarantee that no harm is done.
- With the flywheel placed on a suitable flat surface, position the ring on the flywheel (ensuring that the chamfer of the teeth are on the correct side of the flywheel). The ring may need to be drifted on until it abuts the location flange of the flywheel. Hold the ring against the flange until the ring contracts sufficiently to grip the flywheel.
- Allow the flywheel assembly to cool gradually, do not hasten the cooling in any way (thereby avoiding the creation of internal stresses in the ring which may cause fracture or failure in some respect).

Cylinder Head 1275cc (1967-1974)

ill.	Part Number	Price £ea.	Description	Req.	Details
NI	GCG1009	£374.20	CYLINDER HEAD, recon, exchange (With valves, guides & springs).	1	lead free
NI	AJM1140	£20.00	GASKET SET, top end	1

41	CHS2515	£1.00	STUD, elbow to head (Vertical flow radiator).	3	To G-AN4-66225 and H-AN9-77590
	CHS2518	£1.00	STUD, elbow to head (cross flow radiator).	3	From G-AN4-66226 and H-AN9-77591, all G-AN5, H-AN10 and A-AN10 cars

Torqueing Down The Cylinder Head

The hardware (studs, washers, nuts) to hold the cylinder head to the block are all listed in the external engine section on pages 120 & 121.

Note: There are two alternative materials from which the cylinder head studs are made. Thus, because of variable material characteristics, there is a choice of torque settings for tightening the nuts down on different head studs. On studs with '22' or a small drill point on the end, the nuts should be tightened to 50 lb. ft. (6.91 kg.m.), on studs with plain ends, the nuts should only be tightened to 42 lb. ft. (5.81 kg.m.).

55	12G1926	£7.73	PEDESTAL, plain	3	} rocker shaft
56	12G1927	£6.50	PEDESTAL, with tapped hole	1	
57	2A259	£3.35	LOCATING PLATE, pedestal	1

66	6K878	NCA	END PLUG, plain	1	
67	2K4608	NCA	END PLUG, screwed	1	

Information on Valve Rockers

If you need to order rockers, please read the following notes carefully. There are three different types of rocker which may be found on an 'A' Series engine:

12G1221 Forged Rocker: This is the one fitted in preference by BMC to MG engines (and is also, out of the three standard types, the one favoured for competition work). Reasonably light and strong, it has the added bonus of having a replaceable bush unlike the other two types of rocker listed here. They should not be difficult to obtain.

2A964 Pressed Steel Rocker: The least attractive of the three types, due to its lack of strength. Fitted as an alternative to the forged rocker during production. Not easy to find today. They can be replaced by using a sintered steel rocker (CAM289), or a forged rocker (12G1221).

CAM289 Sintered Rocker: To be found on all factory replacement 1275cc engines from the late 1970's onwards (and still used in new 'A' Series engines today). Commonly available. All rockers are interchangeable in sets of eight only. Care must be taken to use the appropriate tappet adjusting screws & lock nuts. When substituting CAM289 rockers for either of the older types, note that a pair of Thackery (double coil) washers will have to be added to the rocker shaft assembly and that the six spacer washers at the ends of the springs will have to be removed. Incidentally, long ago, there was a cast rocker (2A533) which was also used on 'A' Series engines - luckily not the 1275cc Sprite & Midget unit.

70	12G1221	£10.40	ROCKER, forged (Must be reamed to suit rocker shaft).	8	} forged rockers
71	2A21	£1.94	BUSH	8

105	88G459	£1.15	SPLIT COLLET	16	2 per valve

1275cc A Series Engine Colour Schemes

Only engines bearing a 12CC engine no. prefix were painted in British Motor Corporation Engine Green (the colour somewhere between Sage Green and Olive Green) applied to the power units in most BMC motor vehicles, including all the Sprite & Midget variants prior to 1967. This equates to roughly the first year of 1275cc production. Following this (from 1968 to 1971) came the 12CD and subsequent 12CJ units, both peculiar to 'emission controlled' cars bound for the North American market; during this period the rest of the world received Sprites & Midgets with 12CE engines. All three of these engine types were painted in a very pale silvery-green; the colour was the same as that which was then being applied to engines in MGC's and the Austin Healey 3000's.

From late 1971 to the end of 1275cc Midget production (the manufacture of Sprites by this point had finished), all cars were fitted with variants of the 12V engine range. The 12V engines were a fairly successful attempt by British Leyland to rationalise the build specifications of the myriad of 1275cc engine variants currently being used. In true Henry Ford tradition, from late 1971 onwards, all engines were black. This state of affairs continued past the end of Midget production until the beginning of the 1980's and the introduction of the considerably modified 'A+' engines for use in the Metro, Mini, Ital, etc.

It's also a fact that whatever the colours or natural unpainted finishes of the engine ancillaries were when they left their respective manufacturers, once they were fitted to a new engine they were at least unintentionally over-sprayed - if not deliberately, painted the same colour as the engine. This statement applies to thermostat housings ('elbows'), inlet manifolds, water pumps, heater taps, starter motors, oil filter heads, dynamos, alternators and distributors. Even the distributor cap, plug leads, spark plugs, oil filler cap and spin on oil filter cartridges were sometimes camouflaged, although of course they reverted to their more contrasting colour schemes as the vehicle was serviced.

The only power unit item over which care was taken to preserve its colour was the cooling fan. For safety reasons, naturally, the cooling fan was always finished in a high visibility chromium yellow: early vehicles carried a painted metal fan, later vehicles having a self coloured plastic item. The gearbox, which was also attached to the engine on the power unit production line, more often than not also left the line in the same colour as the engine.

Two more colour schemes should probably be discussed here: Factory remanufactured (it gave a better impression than calling them 'reconditioned') exchange units were for many years, in fact back through BMC days, known as Gold Seal units and therefore painted...metallic gold. At the end of the 1970's a range of second condition remanufactured units were launched under the banner of Silver Seal. Units offered in the Silver Seal scheme were (wait for it...) silver, which looked very similar in texture to the ubiquitous hammered finish enamel you see in your local accessory shop.

The major units (engines and gearboxes) were completely painted in gold or silver, while lesser units (starter motors, dynamos, etc.) were finished in gold and satin black for Gold Seal, or natural metal and satin black for Silver Seal.

Engines & External Components 1500cc (1975-1979)

The 1500cc Engine

The Standard Triumph 'Small Car' engine was first seen in the Standard Eight of 1953. By coincidence, its capacity of 803cc was the same as that of BMC's 'A' series engine, introduced a year earlier in the diminutive Austin A30 saloon. Both engines were developed and increased in capacity through the years, as market forces dictated more performance and, the cars that the engines were put into became larger and heavier.

The 'A' series of course powered all Sprites & Midgets from 1958 to 1974, from 948cc guise through 1098cc and finally 1275cc. With impending USA market emission regulations set to curtail performance of the Midget (the Sprite by this time was no longer produced) to an unacceptably low level, something had to be done to enable sales of the car to continue in its biggest market place. By 1974, the 'Small Car' engine had similarly been taken out to bigger capacities, the largest being the 1493cc units to be found in the Triumph 1500cc saloon (later part of the Dolomite range) and certain export market Triumph Toledo saloons. This engine was also used in the USA market Spitfire MkIV, because early 1970's USA emissions regulations had already precluded the fitment of the 1296cc 'Small Car' unit, used in Spitfire MkIV's in all other market places.

The 1493cc unit (rounded up to 1500cc for model nomenclature) would be easier to adapt than BMC's 1275cc 'A' series to meet ever more stringent regulations, so the Midget was re-engineered to accept the Triumph 1500cc engine, along with the Triumph 'single rail' gearbox (which was by now British Leyland's standard rear wheel drive sub-2000cc car gearbox). The Midget 1500cc is certainly a more tractable vehicle than its 'A' series engined predecessors, even if some feel it to be a little less sporting or zestful. Over the years it has developed something of a reputation for unreliability; it has to be acknowledged that there is an 'Achilles Heel' in its design, namely the supply of lubricant around the unit. There are two useful modifications on the market which deal with the problem. If the external rocker feed kit (see page 130) and an oil cooler kit (see page 132) are both fitted (and they are easy to install) there is no reason why a Midget 1500cc should be any less reliable than its counterparts.

'Lead Free' 1500cc Full Engines (Reconditioned)

Our 'lead free' 1500cc full engines are rebuilt by a major engine re-conditioner.

Note: All work is carried out to customers own unit. Price quoted excludes external ancillaries. Please contact your local Moss branch for full details.

ill.	Part Number	Price £ea.	Description	Req.	Details
	GSE2459E	£1621.00	FULL ENGINE, (1500cc), recon/exchange	1	standard
	GSE2459BFC	£1990.00	FULL ENGINE, (1500cc), recon/exchange	1	standard, balanced unit (clutch & flywheel balanced)
	GSE2459ST2	£2570.00	FULL ENGINE, (1500cc), recon/exchange	1	stage 2, balanced unit (clutch & flywheel balanced)

Short Engines (Reconditioned)

Our short engines are rebuilt by a major engine re-conditioner.

Note: All work is carried out to customers own unit. Price quoted excludes external ancillaries. Please contact your local Moss branch for full details.

Comprising reground crankshaft and camshaft, re-bored cylinder block, new bearings, oil pump, timing chain, seals and gaskets. The unit is fully assembled up to the head face.

Timing Cover Fitting Hardware Locations

The positioning for all the nuts, bolts, screws, washers and dowels on the timing cover is crucial. Get it wrong and stripped threads and oil leaks may result. Here are all of the fasteners & their relevant washers, listed in clockwise order (A to P) when viewed from the front of the engine. Position A is the uppermost, centrally located 5/16" diameter dowel.

A	DP514	£1.00	DOWEL	1	5/16" diameter

Internal Engine 1500cc (1975-1979)

Note: Please see the Accessories section for performance parts.

Ill.	Part Number	Price £ea.	Description	Req.	Details
1	155357	£11.70	NUT, pulley retaining	1	
2	217789	£116.20	PULLEY	1	
3	207492	NCA	TIMING COVER	1	single timing mark
	217790	NCA	TIMING COVER	1	multiple timing mark
4	UKC1110	£2.60	SEAL, timing cover	1	
5	211126	£1.50	GASKET, timing cover	1	
6	GHF332	£0.20	WASHER, locking	5	
7	SE605031	£1.15	SCREW, (pan head)*	5	timing cover
8	SH605071	£0.46	SCREW, (hex head)*	6	to block

*Note: For screw positions, please see 'Timing Cover Fitting Hardware Location' notes on page 127.

9	GHF332	£0.20	WASHER, locking	6	
10	GHF201	£0.08	NUT	1	
11	GHF332	£0.20	WASHER, locking	1	
12	119390	£6.00	OIL THROWER	1	
13	119389	£24.50	TIMING GEAR, crankshaft	1	
14	145275	£0.71	SHIM, crankshaft, 0.004"	a/r	
	145276	£0.94	SHIM, crankshaft, 0.006"	a/r	
15	RKC918E	£246.00	CRANKSHAFT, recon/exchange	1	

	RKC918E	£246.00	CRANKSHAFT, recon, exchange	1	
16	105115	£5.80	WOODRUFF KEY	1	
17	RTC1753	£17.80	MAIN BEARING SET, standard size	1	
	RTC1753/10	£17.80	MAIN BEARING SET, 0.010", oversize	1	
	RTC1753/20	£17.80	MAIN BEARING SET, 0.020", oversize	1	
	RTC1753/30	£17.80	MAIN BEARING SET, 0.030", oversize	1	
	RTC1753/40	£17.80	MAIN BEARING SET, 0.040", oversize	1	

Note: When the crankshaft has been reground (undersize), an oversize bearing set will be required to suit. Be sure to check this BEFORE ordering bearings. Bearing sets that have been opened and used to "check" the crank size will not be acceptable for exchange as this process invariably damages the precision finished soft face of the bearing. This also applies to big end (con rod) bearings.

18	TKC1840E	£109.70	FLYWHEEL, (standard)	1	includes ring gear
	TKC1840X	£325.00	FLYWHEEL, (lightweight/steel)	1	

Note: Please see the Accessories section for details of lightweight flywheels.

19	201350	£19.60	RING GEAR*	1	
----	--------	--------	------------	---	--

*Note: Please see page 123 for advice on replacing the starter ring gear on a flywheel.

20	105143	£3.00	SPIGOT BUSH	1	
21	UKC4254	£2.95	BOLT, flywheel	4	
22	DP408	£1.00	DOWEL, (locating clutch cover)	3	in flywheel
23	DP619	£1.49	DOWEL, (locating flywheel)	1	in crankshaft
24	146454R	£36.00	CON ROD, standard/reconditioned	4	
	146454X	NCA	CON ROD, (steel billet type)	4	high performance rods
25	119813	£1.85	BUSH, connecting rod	4	('small end')
26	107401	NCA	LOCATING TUBE, (in con rod)	8	
27	UKC2598	£3.70	BOLT, connecting rod*	8	

*Note: Always fit new connecting rod bolts, - they are a 'stretch bolt' design & the manufacturers recommend they are only used once.

28	RTC1754	£15.90	BEARING SET, con rod*	1	standard size
	RTC1754/10	£15.90	BEARING SET, con rod*	1	0.010" oversize
	RTC1754/20	£15.90	BEARING SET, con rod*	1	0.020" oversize
	RTC1754/30	£15.90	BEARING SET, con rod*	1	0.030" oversize
	RTC1754/40	£15.90	BEARING SET, con rod*	1	0.040" oversize
	RTC1754/60	£15.90	BEARING SET, con rod*	1	0.060" oversize

*Note: See information notes for item 17 relating to bearing sets.

29	BHM1366	£7.00	THRUST WASHER, pair	a/r	standard size
	BHM1366/2	NCA	THRUST WASHER, pair	a/r	0.002" oversize
	BHM1366/5	£7.00	THRUST WASHER, pair	a/r	0.005" oversize
	BHM1366/10	£7.00	THRUST WASHER, pair	a/r	0.010" oversize
	BHM1366/15	£7.00	THRUST WASHER, pair	a/r	0.015" oversize
	BHM1366/25	NCA	THRUST WASHER, pair	a/r	0.025" oversize
	BHM1366/30	£7.00	THRUST WASHER, pair	a/r	0.030" oversize
30	155169	£121.61	PISTON Set, standard size	1	engine set
	155169/20	£121.61	PISTON Set, 0.020" oversize	1	
	155169/30	£121.61	PISTON Set, 0.030" oversize	1	
	155169/40	£134.40	PISTON Set, 0.040" oversize	1	
	155169/60	£121.61	PISTON Set, 0.060" oversize	1	
(Hepolite pistons are supplied in matched sets and include rings, gudgeon pins & circlips. (Single replacement pistons may also be available, please enquire).					

Note: It is always advisable to replace pistons in sets, though not compulsory. If the block is to be re-bored it is essential to complete this process before ordering pistons as the bores may not 'clean up' at the next oversize. Where performance is significant however, use the largest size available because even a 0.040" bore oversize will produce a measurable power difference.

31	146485	NCA	GUDGEON PIN	4	
32	508978	£0.66	CIRCLIP	8	
33	BHM1175	£31.10	RING SET, standard size	1	engine set
	BHM1175/20	£31.10	RING SET, 0.020" oversize	1	
	BHM1175/30	£31.10	RING SET, 0.030" oversize	1	
	BHM1175/40	NCA	RING SET, 0.040" oversize	1	
	BHM1175/60	£31.10	RING SET, 0.060" oversize	1	
34	143552	£3.10	CAM FOLLOWER	8	
35	157508	£4.62	PUSH ROD	8

70	BH604221	£0.62	BOLT, pump to block	3	

Duplex (twin row) Timing Chain Modification for 1500cc engines

Timing chain stretch or tensioner breakage are not unknown on the 'simplex' (single row) chain and gear installation in the MG Midget 1500cc engine. The timing gear set can easily be modified when chain or tensioner renewal becomes necessary, to a more robust 'duplex' design. Duplex timing gear sets include a twin row chain, modified timing gears and wider spring tensioner (duplex timing gear sets are, of course, standard fitment on 1275cc Sprites & Midgets). A 1500cc engine may be modified only by using all of the components listed below. Actually, the components are sourced from the 1500cc engine's very close (in component design & dimensions) bigger brother, the Triumph 'large car' model PE156 engine, as fitted in the Triumph TR5 Pi & TR6 Pi.

145864	£34.70	TIMING GEAR, crankshaft, duplex	1
145865	£40.00	TIMING GEAR, camshaft, duplex	1
2H4286	£7.60	CHAIN, timing, duplex	1
145866	£5.39	TENSIONER, timing chain, duplex	1
036411	£0.70	LOCK TAB, camshaft	1
PS103121	£0.67	SPLIT PIN	2
211126	£1.50	GASKET, timing cover	1
UKC1110	£2.60	SEAL, timing cover	1

The fitting method of duplex timing gears is as per the original installation. The factory workshop manual should be consulted where applicable to ensure the engine valve timing is correctly maintained.

Distributor Drive & Pedestal Clearance

When fitted, a running clearance or end float of 0.003" to 0.007" (0.005" +/- 0.002") is required between the distributor drive spindle & gear, and the distributor pedestal housing. Too much end float and the drive will chatter between the bush in the block and the pedestal housing lower running face. Too little clearance and it may bind and damage its driving gear on the cam shaft. Either of these conditions will result in rapid and excessive wear. The clearance is adjusted by varying the quantity of gaskets fitted between the base of the pedestal housing and the cylinder block. The gasket, (part number 104939), has a nominal thickness of 0.006". However, gasket thickness should be checked for each application.

To check the clearance when components have been replaced, the following procedure should be used:

1. Install the drive in the cylinder block bush with a washer of known thickness on the shaft between the base of the gear and the bush end face. The washer should be of 1/2" internal diameter to fit the shaft.
2. Fit the pedestal housing over the drive without any gaskets, using nuts to retain it. Measure with feeler gauges all the way round the gap between the pedestal housing and the cylinder block. The measurement should be noted.
3. Disassemble the pedestal housing and extract the drive with the known thickness spacer washer from the cylinder block.
4. Calculate the existing clearance without gaskets by subtracting the dimension of thickness of the spacer washer from the figure obtained with feeler gauges. This figure should be a negative amount. Find the correct quantity of gaskets required to obtain the running clearance of 0.003" to 0.007".

Example:	Washer thickness	=	0.125"
	Gap measured with feelers	=	0.142"
	Subtract gap dimension from washer thickness	=	0.017"
	Add the thickness of gaskets	=	0.024"
	Clearance obtained with 4 gaskets	=	0.007"

In the event of the difference between the gap and the known washer thickness being a positive amount in excess of 0.003", remedial action will be required to reduce it. This can be achieved by selective assembly using other drives or pedestal housings. If, even with new components, the correct figure can not be obtained, the bush height in the cylinder block must be adjusted. Remove, inspect for serviceable condition and refit the bush with a suitable thickness shim between its mating face and the cylinder block. The bush should be either carefully driven out from below using a suitable spigoted drift, or pulled out from above with a bushing extractor. With the bush replaced securely, the above end float checking procedure should be adopted. The method of completing this job by fitting the distributor drive and setting its timing is detailed in the workshop manual.

Cylinder Head 1500cc (1975-1979)

Notes: Please see the Accessories section for performance parts.

ill.	Part Number	Price £ea.	Description	Req.	Details
1	TKC1155	NCA	CYLINDER HEAD, bare, new	1	
	TKC1155LFE	£346.60	CYLINDER HEAD, lead free, recon. (With valves, guides & springs).	1	exchange

65	132495	£2.40	STUD	4	rocker shaft to cyl. head
66	PC10	£0.19	SPLIT PIN	1	front end of rocker shaft
68	TT1226	£35.00	EXTERNAL ROCKER FEED KIT (This bolt-on, easy-to-fit kit improves the oil supply to the most distant parts of the engine, so insuring against rocker & shaft wear).	1	

Curing Oil Consumption and easy Valve Spring Removal

Excessive rocker shaft wear is a classic complaint about Triumph push rod engines, of which the Midget 1500cc unit is one. The rocker feed kit is an effective (and easy to fit) solution to the problem. It works by piping oil directly from a plug hole in the cylinder block main oil gallery up to the cylinder head, thereby maintaining a higher pressure oil supply than standard. No drilling or tapping is required for installation.

If a rocker feed kit is fitted to the engine, an increase in oil consumption may be encountered. The extra amount of lubricating oil flowing through the valve & rocker chamber, as supplied by the feed kit, exaggerates any tendency for oil to be sucked down worn valve guides past worn valve stems. The best solution is to fit new valves & guides, but this is not always on the top of the repair priority list. To assist in the reduction of oil being sucked down the guides a method of sealing the valve stems is required. The simple rubber rings that are used so successfully on other MG sports cars - part number AEK113 (8 are required, one per valve stem), will service an engine. Each seal fits on the valve stem above the valve guide but below the valve spring retaining cap.

Now the clever bit...how to fit them without removing the cylinder head from the car. Remove the rocker cover, rocker gear and the spark plugs. Cover the holes that the push rods come up through so nothing can be dropped down into the engine. Turn the crankshaft so that number one piston is at Bottom Dead Centre (BDC). Feed a length of clean, pliable rope down the spark plug hole of number one cylinder, leaving a bit hanging out so you can retrieve it. Now carefully turn the crankshaft clockwise by hand; resistance will be felt as the rising piston in number one cylinder compresses the rope against the two valves in that cylinder, holding them against their seats.

The collets and spring caps of the valves in that cylinder can now be removed without the fear of losing the valves down the bore. The valve stem oil seals can be fitted to the two valve stems (perhaps new valve springs as well, while everything is apart). Once the valve stem oil seals, valve spring caps and collets have been refitted to this first pair of valves satisfactorily, simply turn the crank anti-clockwise to BDC, withdraw the rope and repeat the process on the remaining three cylinders and three pairs of valves. Be honest, this tip saves the cost of a head gasket set!

To be sure that the rope has compressed sufficiently against the faces of the valves, attempt to push the valves by hand (as if being acted on by the rockers) before removing the spring caps or collets, this is the fail safe check. This method can be adopted anywhere as it does not require the use of compressed air, special tools or luck.

1500cc Triumph 'PE94' Engine Colour Schemes

Unlike the 1275cc 'A' series engine, the 1500cc engine was always black. The only component of the engine which differed from this rule was the rocker cover, which for anything other than North American markets was always silver (in America, a red rocker cover signified a car built to comply with Californian emissions regulations, whereas light blue indicated compliance with the marginally less severe general or 'Federal' regulations.

Again, contrary to the 1275cc engine, ancillary items on the 1500cc engine remained in the colour scheme or finish given to them by their respective manufacturers. No over-spray of engine colour onto the ignition equipment, alternator or manifold to be seen here. In fact a much more quality inspired presentation of the engine bay than on previous Sprites & Midgets.

Oil leakage from the Rocker Cover

Do you suffer with a permanent puddle of oil in the recess around the mounting flange of your rocker cover? If so, it is either because you have spilt oil when topping up the engine, or the oil fairy has been around. This malevolent character is the one that always drips oil onto an area that you have scrupulously cleaned previously. The truth is that the oil is leaking from an unseen joint on your engine (unless you do believe in bad fairies).

The items that create the oil puddle on the rocker cover are the oil filler cap and the sealing washers under the fasteners holding the rocker cover. A quick look at the rocker cover oil filler cap's seal will eliminate one possible cause. If it is in any way perished, torn or otherwise damaged, renew the cap and seal assembly (part no. GZC1400).

The seal is important on two counts: It should not leak oil, nor should any air be drawn into the engine past it. This is because the inlet manifold is connected directly to the engine breather on the rocker cover. The nuts or screws that retain the rocker cover are not quite so easy to attend to, unless of course they are obviously loose or there are no sealing washers present.

Over tightening the fasteners will end up distorting the top of the rocker cover rather than curing the leak. The area of rocker cover around the holes where the attachment studs pass should be inspected. This area should be flat, so that a sealing washer can work effectively on it. If it is not flat, the rocker cover should be removed from the engine, and the area around the stud hole dressed flat with a hammer & block.

(A suitable block or dolly to assist in the repair of an original, pressed steel rocker cover would be a length of flat ended one inch round bar held vertically in a vice). The rocker cover can be placed over the bar with the stud hole concentric to the bar and dressed back to shape with a smooth faced hammer. If care is exercised when hammering, the painted finish of the rocker cover will not be damaged. The latter repair scheme is only relevant, as previously stated, to original pressed steel rocker covers. If a replacement alloy rocker cover is distorted in this area by over tightening, the cover should be inspected for cracks and if none are present the sealing area could be re-machined. If not, a replacement should be sought.

Oil Cooler 1275cc

Oil Cooler 1500cc

Oil Cooler (Engine)

A hot engine will suffer, depending on its mechanical condition, a greater or lesser degree of oil pressure loss without the aid of an oil cooler. This is most apparent in heavy traffic congestion or on long motorway journeys. A correctly positioned oil cooler (you can't go wrong - the mounting holes are present in every front valance, whether you previously had an oil cooler fitted or not) maintains lower oil temperatures and thus higher oil viscosity, resulting in higher pressure. This all amounts to longer engine life and freedom from being transfixed by the needle of your oil pressure gauge.

Oil coolers were offered as an optional extra by the factory on 1275cc Sprites & Midgets. They were also available with installation kits from BMC/BL Special Tuning. Ironically, British Leyland never offered an oil cooler for the Midget 1500cc (which benefits from one more than any previous Sprite or Midget). Kits and components are offered here for all models, based where possible on original factory equipment.

Oil Cooler Kit 1275cc

(G-AN4, G-AN5, H-AN9, H-AN10 and A-AN10 models)

Ill.	Part Number	Price £ea.	Description	Req.	Details
1	GAC4091	£141.90	OIL COOLER & INSTALLATION KIT (Our oil cooler kits include a ten row oil radiator, hoses and universal mounting brackets and hardware).	1	
2	AR09807	£66.00	OIL COOLER, ten row	1	
3	AHA8386	£11.75	BRACKET, oil cooler support	1	
4	SE604051	£0.35	SCREW, cooler to bracket	4	
5	SH604041	£0.20	SCREW, bracket to body	4	
6	GHF331	£0.12	WASHER, locking	8	
7	GHF200	£0.14	NUT	8	
8	AHA8778	£19.50	HOSE, cooler to filter, 33.5"	1	rubber
	AHA8778SS	£33.60	HOSE, cooler to filter, 33.5", braided	1	stainless steel
9	AHA8777	£18.50	HOSE, cooler to block, 45"	1	rubber
	AHA8777SS	£33.60	HOSE, cooler to block, 45", braided	1	stainless steel
10	AHA6423	£5.18	ADAPTOR	1	hose to oil filter head
11	AHA6424	£8.00	ADAPTOR	1	hose to block
12	12A1768	£1.03	WASHER, sealing	1	
13	AHA8779	£10.90	BRACKET	1	hoses to wheel arch
14	SE604041	£0.25	SCREW	1	bracket to wing drain channel
15	SH604071	£0.56	SCREW	1	bracket to wheel arch
16	GHF331	£0.12	WASHER, locking	2	
17	GHF200	£0.14	NUT	2	
18	AHH6866K	£3.50	STRAP KIT	2	
19	AHA8401	£1.00	GROMMET	4	mud shield & front panel

Oil Cooler Kit 1500cc

(G-AN6 models)

25	GAC4092	£145.00	OIL COOLER & INSTALLATION KIT (Our oil cooler kits include a ten row oil radiator, hoses and universal mounting brackets and hardware).	1	
26	AR09807	£66.00	OIL COOLER, ten row	1	
27	AHA8386	£11.75	BRACKET, oil cooler support	1	
28	SE604051	£0.35	SCREW, cooler to bracket	4	
29	SH604041	£0.20	SCREW, bracket to body	4	
30	GHF331	£0.12	WASHER, locking	8	
31	GHF200	£0.14	NUT	8	
32	HMP215001	NCA	HOSE, long	1	oil cooler to
33	HMP215002	NCA	HOSE, short	1	oil filter adaptor
34	TT1369A	£62.50	ADAPTOR, with seal	1	(use standard oil filter)
35	AHH6866K	£3.50	STRAP KIT	2	
36	AHA8401	£1.00	GROMMET, front panel	4	

Oil Coolers & Thermostat

Oil cooler sizes can be changed to suit different climates or type of vehicle use (road or competition). Choose carefully, though - keeping oil too cool also harms the engine.

40	AR09807	£66.00	OIL COOLER, ten row	1
41	ARA221	£38.00	OIL COOLER, thirteen row	1
42	AR09875	£85.00	OIL COOLER, sixteen row	1
45	TT2960	£46.20	OIL THERMOSTAT, push fitting	1

As an extension of the above point, a thermostat installed in the oil cooler system will help to preserve the optimum running temperature. Fitting involves very easy modification of the oil cooler hoses.

Points to Remember about Oil Coolers

If an oil cooler has just been fitted to a car, check the oil level in the sump and top up as necessary. The oil cooler circuit increases the oil capacity of the engine by well over a pint. However, in future when draining the engine to change the oil, note that the old oil will remain in the cooler circuit unless both radiator & hoses are removed from the car to upturn and empty them. Thus the quantity of oil required to effect an oil change on a car with an oil cooler will still be the same as that for a car without one. To prevent over cooling of the oil in cold weather, tin foil can be used to temporarily cover the oil radiator, in the same age old manner that it has always been used by people to cover the water radiator. If an oil thermostat is fitted to the car, there is of course no need to do this. Remember when undoing a hose from the radiator to use two spanners; one to undo the tube nut on the hose, the other to put on the hexagon of the radiator union to stop it turning with the nut. It's surprising how easily a union can be twisted out of the radiator, rendering the item scrap.

Engine & Gearbox Mountings

The following procedure is suggested when removing the engine:

On the side of the engine bay with the steering column in it, undo the mounting from the engine (leaving the mounting and bracket on the car body). On the other side, undo the bracket from the body, (leaving the mounting and bracket on the engine). The result will be:

- A) You only undo the bits you can see and get at (have a look and you will understand).
B) Upon re-assembly, you don't tear the thread off the studs on the mountings as you try to jam the engine down into the 'V' cradle formed by the brackets.

Engine & Gearbox Mountings 1275cc

(G-AN4, G-AN5, H-AN9, H-AN10 and A-AN10 models)

Ill.	Part Number	Price £ea.	Description	Req.	Details
51	AHA5484Z	£4.80	ENGINE MOUNTING	2	
52	CHA219	NCA	BRACKET, engine mounting LH	1

103	GHF301	£0.13	WASHER, plain	2	
104	CHA266	NCA	BRACKET, mounting support	1	
105	SH605061	£0.14	SCREW	2	
			(Bracket to gearbox tunnel side).		
106	GHF332	£0.20	WASHER, locking	2	
107	PWZ205	£0.20	WASHER, plain	2	
108	BH606281	£1.20	BOLT, bracket to floor	2	
109	GHF333	£0.20	WASHER, locking	2	
110	GHF302	£0.46	WASHER, plain	2	
111	CHA487	NCA	RESTRAINT BRACKET	1	
112	CHA488	NCA	BUSH, restraint	2	
113	BH605101	£0.64	BOLT, restraint bracket to gearbox	2	not fitted (To early 1975 models*)
114	GHF301	£0.13	WASHER, plain	2	
115	GHF332	£0.20	WASHER, locking	2	
116	GHF201	£0.08	NUT	2	

*Note: This restraint, stopping the gearbox hitting the tunnel, was introduced soon after the beginning of 1500cc production. If your early 1500cc has a vibration/knock through the floor, see if the restraint is fitted. If not, acquire one and fit it next time the gearbox comes out. If the restraint is in place and you still have a knock, the bushes have chafed through (or you have a broken exhaust mounting or propshaft joint).

Engine & Gearbox Mountings 1275cc

Engine & Gearbox Mountings 1500cc

Over-Cooling Problems?

The vertical flow radiator and cooling system on earlier Sprites & Midgets always seems, when in a good state of repair, to be perfectly balanced; never too cool in cold weather (in fact the warmth from the heater is particularly comfortable, even in the harshest of winter weather) and only grudgingly too warm in the heaviest of August bank holiday traffic. So why was the system changed? The cross flow radiator was introduced in 1968 to allow clearance for the emission control equipment then required for the American markets. In the interests of standardisation, all markets got the new radiator (though thankfully not the anti-smog gear as well). While it is a great success in the hot American west coast region, the intended market place for the lion's share of sports cars at that time, it is in truth a little too efficient in lukewarm European climes. The temperature gauge usually errs on the cold side of normal and in winter weather the engine sometimes doesn't warm up properly, running lean and requiring the occasional tug on the choke control to pull away from a junction. Not to mention that the heater doesn't roast your toes as you would like it to.

When you prepare your car for the winter, flushing out the old and filling the system with new anti-freeze, try fitting an 88° C thermostat (part no. GTS106) at the same time. It will let the water get that little bit warmer and thus work wonders on the running of the engine and the heater.

Cooling System 1275cc (1967-1974)

(All G-AN4, G-AN5, H-AN9, H-AN10 and A-AN10 models)

Thermostat

Ill.	Part Number	Price £ea.	Description	Req.	Details
1	12G243	£17.00	ELBOW, water outlet	1	To G-AN4-66225
2	CHS2515	£1.00	STUD, elbow to head (Vertical flow radiator).	3	and H-AN9-77590
3	12G1902	NCA	ELBOW, water outlet	1	all later G-AN4,
4	CHS2518	£1.00	STUD, elbow to head (Cross flow radiator).	3	H-AN9, G-AN5, H-AN10 and A-AN10 models
5	GHF201	£0.08	NUT	3	
6	GHF332	£0.20	WASHER, locking	3	
7	GTS102	£3.40	THERMOSTAT, 74°C, 160°F	1	hot climate
	GTS104	£3.60	THERMOSTAT, 82°C, 180°F	1	standard
	GTS106	£4.20	THERMOSTAT, 88°C, 195°F	1	cold climate
8	GTG101	£0.29	GASKET, thermostat housing, cork	1	standard material
	GTG101X	£1.03	GASKET, thermostat housing, Klingsil	1	uprated material
9	AJJ4012	£8.60	BLANKING SLEEVE KIT, thermostat*	1	competition
10	AJJ4013	£20.00	BLANKING KIT, bypass hose*	1	use only

*Note: Fitting a blanking sleeve to replace a thermostat is conceivable for a road car, but it does (except in extreme conditions) stop the engine getting to normal working temperature. If using a blanking sleeve, also remove the bypass hose and blank off its unions. Never omit the thermostat from the system without fitting a blanking sleeve instead.

11	12A2075	£5.00	ADAPTOR, bypass hose	2/1	see note before item 19
12	GZA2083	£1.30	HOSE, straight, bypass	1	
	GZA2083X	£2.50	HOSE, straight, bypass, silicone	1	
13	GZA2083Z	£3.30	BYPASS HOSE, temporary repair	1	may be fitted without removing pump
14	3H2963	£0.76	CLIP, bypass hose	2	
15	ADP210	£6.24	PLUG, blanking, (vertical flow radiator)	1	To G-AN4-66225
16	1B3664	£0.29	WASHER, sealing	1	and H-AN9-77590
17	11K2846	£3.00	ADAPTOR, temperature transmitter (Cross flow radiator).	1	From G-AN4-66226 and H-AN9-77591, all G-AN5, H-AN10 and A-AN10 cars
18	AED172	£0.95	WASHER, sealing	1	

Water Pump & Fan

Until early 1968 a cast iron pump was fitted, after that an alloy pump. The major differences are (a) diameter of the bottom hose connection (necessitating different hoses) and (b) the cast iron pump has a screw in bypass hose adaptor, where the alloy pump has a boss in its casting. The pumps are interchangeable only if the correct bottom hose is used.

19	GWP132	£16.50	WATER PUMP, cast iron body	1	12CC, To 12CE/Da/H873
20	GWP134	£15.20	WATER PUMP, alloy body	1	all later 12CE & 12V engines
21	88G215	£0.46	GASKET, water pump	1	
22	BH605151	£0.60	BOLT, pump attachment, long	2	
23	SH605101	£0.70	SCREW, pump attachment, short	2	
24	GHF332	£0.20	WASHER, locking	4	
25	12A1344	£0.65	DOWEL, pump locating	2	use with cast iron water pump
	12G2077	NCA	DOWEL, pump locating	2	use with alloy water pump
26	CAM6239	NCA	PULLEY, water pump & cooling fan	1	
	CAM6239A	£59.40	PULLEY, water pump & cooling fan	1	aluminium
30	AE6559	NCA	COOLING FAN, metal	1	
31	SH604111	£1.15	SCREW, (fan & pulley to water pump)	4	
32	12H1388	£0.50	LOCK TAB	2	all 12CC, To 12CE/Da/H898
33	12H1060	£0.40	GROMMET, fan mounting	2	
34	12H1062	£0.50	DISTANCE PIECE	4	
35	12G1597	£31.20	COOLING FAN, plastic	1	
36	SH604111	£1.15	SCREW, (fan & pulley to water pump)	4	all later 12CE and 12V engines
37	GHF331	£0.12	WASHER, locking	4	
38	GHF300	£0.14	WASHER, plain	4	
39	GCB10863	£6.00	FAN BELT	1	all 12CC, 12CE and 12V/586F
	GCB10838	£4.00	FAN BELT	1	12V/588F/101 To 3192
	GCB10813	£4.80	FAN BELT	1	12V/588F/3193 On, 12V/778F

Filling the Radiator

To fill the cooling system with water is not a simple 'cap off & top up' job if there is a 'cross flow' radiator present, as on later 1275cc cars & all the 1500cc cars. The best time to check & replenish the system is when it is cool. Servicing a hot, pressurised water system is

hazardous and should obviously be avoided if at all possible. To fill the system, the screwed filler plug (situated either in the top corner of the radiator on 1275cc cars, or in the top of the thermostat housing on 1500cc cars) must be removed. Prior to undoing this plug, ensure no pressure exists in the system by having first removed the pressure cap from the expansion tank. With the screwed plug removed, a water/anti freeze mixture can be slowly added until the system has been filled. When absolutely no more liquid can be added, the plug can be refitted with a new sealing washer (part no. TRS1418 for a brass plug, - 607025A for a plastic plug) and tightened. It may be beneficial to squeeze the top radiator hose while filling is taking place to help the system purge itself of air more quickly & completely. If a brass plug is used, lightly smear an anti seize compound on the threads of the plug; this will aid removal at a later date. With the plug refitted, the expansion tank can be filled half way with the same liquid mixture. The pressure cap may then be replaced on the expansion tank and the cooling system will be correctly filled.

Regular checks should be made (and top-ups if necessary) on the level of fluid in the expansion tank, but refilling after a water system evacuation or overboil can only be done as described above. Just one more problem to address: the hexagon size of the screwed plug usually proves difficult to match a spanner to...unless of course you have already tried your spark plug spanner.

Anti Freeze: Winter Protection and Summer Coolant

Today's anti freezes are of a high quality chemical mix and will no longer deteriorate within 6 months and ruin the cooling system of the engine. However, anti freeze should always be used in the way recommended by the manufacturer and any instructions given should be adhered to. The hidden benefit of using anti freeze throughout the year is that not only does it protect the cooling system from freezing in cold weather, as the name suggests, but it also increases the boiling point of the water; this is ideal for the hotter conditions of summer driving. Most high grade anti freeze solutions also contain an inhibitor that will reduce or eliminate cooling system corrosion. That will stop, for example, thermostat housings and other alloy components from disintegrating.

Triumph Cooling Fans and the 'BOW' Test

Standard Triumph (suppliers of the Midget 1500cc engine and its ancillaries) in the 1960's had a series of unexplained blade failures on plastic cooling fans. Their development department was confused by this, as the fans fitted were of a material and construction which made them capable of rotating a whole lot faster than the engines could, before they failed.

The cause of blade breakage was traced to shock loading, caused by rain water thrown up from the test track or road, when puddles were driven over at speed. Those ever resourceful Triumph chaps at Fletchamstead Highway would have to quickly find a method of viewing the phenomena of fan blade breakage, when the speeding car passed over a puddle. Enter the 'BOW' test. This very expensive piece of test equipment duplicated the conditions of wet roads, providing visual proof of the occurrence. Armed with the results of the test, plastic technology and air duct design could be amended to completely alleviate the problem. What was 'BOW' ? Simply a 'Bucket Of Water' thrown at the rotating fan from different angles to study the effect.

Why is a Pressure Cap Used On a Radiator?

By sealing the cooling system, pressure up to a certain given value is built up and the boiling point of the water is raised. This enables a smaller quantity of water to be used and rather higher (and therefore more efficient) engine temperatures, without the risk of the water boiling. The system is sealed by the radiator cap. The cap consists of two halves, namely a pressure valve and vacuum valve. The pressure valve is a spring which holds the cap's large seal against the inside surface of the filler neck. It will allow pressure to build up to a given value (usually stamped into the top of the cap) and be maintained in the sealed system. The vacuum valve is a small 'poppet valve' that, as the radiator water cools & contracts admits air and restores pressure to atmospheric. Throughout its life, the engine passes through countless temperature cycles that will cause pressure increases and decreases in the cooling system. The radiator cap is therefore working constantly. So when you are seeking solutions to overheating problems...you might just have a worn out radiator cap, not a blown head gasket and cracked block, as friends cheerfully suggested.

Fan Belt Tension

The question of how tight a fan belt should be is not as easy to answer as would first seem; certainly it should be tight enough to drive the engine ancillaries to which it is attached, but not so tight that the bearings of the ancillaries are overloaded. A fan belt that is fitted too tightly will also absorb extra engine power. Fitted too loosely, the belt will slip when accelerating, or, an electrical load is applied to the generating system. Slippage wears out the belt and, the pulleys. The handbooks and service manuals give instructions about belt tension. Maintenance of the belt and its periodic replacement will eradicate one of the most frustrating causes of breakdowns. If the fan belt is replaced before it breaks, the old item could be kept in the boot 'just in case'.

Cooling System Leak Stoppers

The use of proprietary leak stoppers (whether of the fluid type or the stick of material which is designed to be crumbled, stock cube fashion, into the radiator) is often the focus of derision from the motoring enthusiast fraternity. Blocked radiator cores and other maladies are said to result from using leak stopper to 'bodge' a repair on an errant cooling system. Well, read on. There is a Leyland Cars publication, for internal use called 'Parts List Schedules or Modifications - AD047 MG 1500cc'. In the section entitled 'Fuel, Oils & Grease' (you wouldn't believe the variety of lubricants applied to each car when it was built) is the following statement; 'Bars Seal Leak Stopper (insert cylinder of Bars Seal in top radiator hose). Routes: All. Modification Date: 27/05/76.' In other words, from that date onwards, every car that came down the line had a stick of leak stopper in it!

Presumably this was to guarantee against small weeps from a newly assembled system. Continual use of the product to shore up an ailing cooling system might impede water flow (although in theory this shouldn't take place, since leak stopper will only cure in air - i.e. when it finds a leak out of the sealed system), but the product is acceptable when used in moderation.

Master Cylinder & Pedal
(All models)

Note: Although the master cylinder was ostensibly the same from 1967 through to the last car in 1979, in fact the internal details were changed at approximately G-AN6-169643, Midget 1500cc production; the later type, only identifiable by circular marks on the cylinder casting, was henceforth supplied as a service replacement for earlier cars. The moral is that replacing the master cylinder is easy; however if you intend to rebuild your old cylinder you must clearly establish which one you have before ordering components for it.

Bleeding New Clutch Hydraulics

Priming the cylinder (manually filling the cylinder with fluid as well as the reservoir) before fitting doesn't seem to work; in fact, in the struggle to fit the cylinder, a lot of fluid is lost anyway. The only route to sure-fire success is to use a pressure or vacuum bleeding tool to push or draw, the fluid, displacing the air as it goes.

Gunson's Eezibleed is an ingeniously cost effective kit consisting of the basic tools plus a selection of adaptors for different motor cars; it uses air from a spare tyre to propel the fluid under pressure into the system. The only cautionary note is to follow the manufacturer's instructions religiously; seat the adaptors correctly on both the Eezibleed reservoir and the master cylinder, and don't have too high a pressure in the spare tyre.

Another tool, like the hand operated vacuum pump from 'Mityvac' attaches to the bleed nipple on the slave cylinder to draw fluid down the line, collecting waste fluid in its own reservoir. While more expensive than Eezibleed, the Mityvac has the added advantage of a host of other uses, for example checking vacuum systems on distributors, brake servos, etc.

Poor Clutch Disengagement

Remember that the mechanical throw required to disengage the clutch is only very short (about a quarter of an inch), so if you are having problems in engaging the gears (or if you really have to tug on the gear lever to get the car out of gear), there are several reasons which (when added together) will conspire to make your life a misery. In other words, it isn't necessarily just down to defective seals in the master or slave cylinder, or a broken/worn out clutch release bearing.

Check for elongation of the clevis pin holes in the fork ends of the master and slave cylinder push rods; in fact check the clevis pin holes on the pedal and clutch release arm too, as well as the clevis pins themselves (a couple of worn or incorrect diameter clevis pins in elongated holes can certainly amount to all your clutch disengagement problems).

Over many years, or as a result of acting at some time against a heavily sprung (i.e. worn out) clutch cover, the clutch release arm may have bent slightly. Alternatively, the release arm pivot bush may be badly worn. Unfortunately these can only really be checked if the engine is removed from the car, but a common tell-tale of problems in this area is a slave cylinder push rod lengthened (by someone unwilling to remove the engine) with a blob of weld or similar on its inner end. Finally, watch out for a weakened hydraulic hose absorbing fluid pressure by expanding!

Gearbox Units & External Components 1275cc (1967-74)

External Gearbox 1275cc

(G-AN4, G-AN5, H-AN9, H-AN10, A-AN10)

Puddles of Oil!

If, in order to carry out remedial work, you only jack up the back end of your 1275cc Sprite or Midget and subsequently notice a puddle of oil on the floor under the engine, DON'T PANIC! The front cover of the gearbox is not oil tight around a stationary input shaft. Consequently if the gearbox is tipped front end down, oil will dribble out, down the bell housing and on to the floor. Two pieces of advice: Firstly, if you wish to work under the back end of the car, jack up the front end, secure it with axle stands, then jack up the back. Secondly, check your gearbox oil level periodically.

Internal Gearbox 1275cc (1967-74)

Internal Gearbox 1275cc

(G-AN4, G-AN5, H-AN9, H-AN10, A-AN10)

The components listed below are those fitted to all original 1275cc Sprite & Midget gearboxes, which used what were termed 'B' type gears. However, a number of different gearboxes and sets of internal components have been offered as replacements over the years. Please read the technical note on 'A' Series gearboxes on this page before ordering parts.

ill.	Part Number	Price £ea.	Description	Req.	Details
1	22G229	NCA	INPUT SHAFT, ('1st motion shaft')	1	
2	2K6677	£0.66	NUT, input shaft	1	
3	2A3035	£3.50	LOCK TAB	1	
4	6K559	NCA	WASHER, plain	1	if fitted
5	2K8737	£1.24	SHIM, 0.004"	a/r	
	2K8738	£1.03	SHIM, 0.006"	a/r	
	2K8739	£1.55	SHIM, 0.010"	a/r	
6	2A3245	£10.30	BEARING, input shaft	1	
7	6K558	NCA	CIRCLIP, bearing	1	
8	CHM172	£4.84	BEARING, input shaft to mainshaft	1	

10	22G146	NCA	MAINSHAFT, ('3rd motion shaft')	1	
11	22A495	£6.90	PEG	3	
12	22G154	NCA	SPRING	2	
14	AEG3009	NCA	SYNCHRO ASSEMBLY	1	3rd & 4th speed
15	BLS107	£0.29	BALL	3	
16	22G317	£0.55	SPRING	3	
17	22G2033	£8.20	BAULK RING	3	3rd/4th & 2nd speed
20	22G185	NCA	COLLAR, locking	1	
21	22G1121	£117.24	GEAR, 3rd speed	1	
22	22G1120	£80.00	GEAR, 2nd speed	1	
23	22G149	£0.50	NEEDLE ROLLER, (26 per gear)	52	
24	22G156	NCA	COLLAR, locking	1	
25	22G157	NCA	THRUST WASHER, locking collar	2	
26	22G1118	£138.40	WHEEL, 1st speed	1	with 2nd speed synchro
27	22G1119	£66.80	WHEEL, 1st speed*	1	
28	BLS107	£0.29	BALL	3	
29	22G317	£0.55	SPRING	3	

*Note: 22G1119 (wheel, 1st speed) is a repair part; its compatibility with a used 2nd speed synchromesh hub cannot be fully guaranteed, since both items were originally intended to be supplied as an assembly of a matched pair of gears (22G1118). Assuming it is available, you should always use the assembly in preference to individual components.

Variations on an ‘A’ Series Gearbox Theme

The gearbox used on Sprites and Midgets up until the advent of the Midget 1500cc in the mid 1970’s was the mainstay transmission for the British Motor Corporation’s smaller motor cars from the early 1950’s onwards. Having four forward speeds, the top three blessed with synchromesh, it was fitted initially to the rear wheel drive Austin A30/A35 models, then to the Morris Minor in 1956, followed by the Austin A40 ‘Farina’ and the Austin Healey ‘Frogeye’ Sprite. This early version of the gearbox is known as the ‘smooth case gearbox’.

For 1959 the ‘A’ Series gearbox internals were re-housed for use in the radical transverse engine front wheel drive Mini and later the Austin/Morris 1100 saloon. After a long series of developments, including the addition of synchromesh to first gear and several change speed linkage designs, it was still being fitted in new Minis over thirty five years later!

A revamp of the rear wheel drive gearbox made production in 1964, fitted in the latest Morris Minor, Austin A35 van, Austin A40 MkII and (with a different set of ratios) in the new Austin Healey Sprite MkIII/MG Midget MkII. Externally identifiable by the new rib-strengthened gear casing, fundamental changes to the bearings and synchromesh components had taken place within. Finally, a few thousand units later, the last significant change to the rear wheel drive ‘A’ Series gearbox was to be made.

Something had to be done to counter the rising number of complaints from Sprite and Midget owners about the operational noise level when compared to the newer gearboxes in cars built by BMC’s competitors. The solution was to slightly increase the angle of the teeth on the helical cut gears (nothing could really be done to quieten the straight cut gears).

The older design of gears became known retrospectively as the ‘A’ Type gears as the newer, quieter items were christened ‘B’ Type. It is impossible to mix and match ‘A’ and ‘B’ type gears.

So, as the ultimate development of the rear wheel drive unit, it was the ribbed case, ‘B’ Type geared ‘A’ series gearbox which was fitted to all Sprite MkIV’s and Midget MkIII’s (i.e. all 1275cc models) when new.

As the years went by, Sprites and Midgets plummeted to the bargain basement end of the second hand car market (prior to being bestowed with their current classic status). It became quite common to see all manner of engine and gearbox combinations shovelled in under the bonnet, either in ignorance of what should have been fitted, or in a desperate attempt to keep the car running on the typical student shoestring budget.

The situation has not been helped at all in more recent years by gearbox re-conditioners. Leyland, for example, under just one part number, would supply an exchange reconditioned gearbox with one of three different sets of internals (‘A’ Type gears, ‘B’ Type gears or Morris Minor type ratios).

In other words, they rebuilt them with whatever was most commonly available at the time. Consequently the customer got what he or she was given, and was usually blissfully unaware that the new gearbox might not be the right one for the car, or of the problems which might crop up in the future when parts replacement in the gearbox became necessary.

Note: Individual gears are not interchangeable between the gear sets.

So Which Gearbox is Fitted to Your Car?

You definitely won’t, of course, find a Mini transverse unit, and it is most unlikely that any one would have fitted a smooth case gearbox: there are too many modifications required to fit what is essentially an inferior gearbox to the 1275cc engine. Plus, ‘spare’ smooth case gearboxes have been thin on the ground for many years. Therefore, you will have a ribbed case gearbox, with one of three distinct gear sets in it :

- 1. Minor/A35 van/A40 MkII ratios.
- 2. Sprite/Midget ‘A’ Type gears.

3. Sprite/Midget ‘B’ Type gears.

The principal way to ascertain which of the three you have is to open the gearbox and look at the laygear, which is only just visible behind the mainshaft gear cluster. Normally the part number is stamped on the waist between the largest and second largest gears: 22G83 for a Minor gear set, 22G76 for an ‘A’ Type Sprite/Midget gear set and either 22G232 or (more likely) 22G1100 for a ‘B’ Type Sprite/Midget gear set.

To further confirm whether you have a Minor or Sprite/Midget gear set, count the number of teeth on either first, second or third gear, plus the number of teeth on the corresponding cog on the laygear. Divide the former number by the latter and you will have the ratio of that gear.

Sprite & Midget Ratios:	
First Gear	3.2:1
Second Gear	1.916:1
Third Gear	1.357:1
Morris Minor Ratios:	
First Gear	3.618:1
Second Gear	2.173:1
Third Gear	1.41:1

The Plastic Gearbox

There was seemingly one more major development of the rear wheel drive ‘A’ Series gearbox, which never made it into mass production. In the early 1960’s, BMC made a promotional film, the subject of which was the research being carried out at that time into alternative methods of manufacturing motor car components. During the course of the film, a clip detailing ‘lost wax’ casting and sprue casting valve rockers was followed by a view of...a nylon ‘A’ Series gear case. Raymond Baxter’s commentary ran something similar to:

‘...and here we see an experiment to determine the feasibility of mass producing injection moulded plastic gearboxes...’

Evidently it must have turned out not to be feasible; maybe the finished product wasn’t strong enough? Who knows?

The Zizzle Kit

The BMC ‘A’ Series gearbox when fitted with a remote selector mechanism (as is the case with Sprites and Midgets) often emits a fine, vibration rattle (the ‘zizzle’) at cruising speeds or upon engine overrun. It is, it must be said, a particularly annoying feature.

The antidote is simple: the gear lever is supposed to be damped by an arrangement of bushes, plungers and springs, all of which tire quite quickly.

The anti rattle kit (part no. SGB0002) detailed under item 136 on page 141 is inexpensive, it provides all the components needed and is quick and easy to fit - the only part of the gearbox you will need access to is the rear of the remote housing, which protrudes from the gearbox tunnel into the passenger compartment.

Gearbox Units & External Components
1500cc (1975-79)

External Gearbox 1500cc
(G-AN6)

ill.	Part Number	Price £ea.	Description	Req.	Details

Note: For gearbox mountings, see the engine mountings section on page 133.

Bell housing drainage

Some (but apparently not all) 1500cc gearbox bell housings have a small hole at the bottom, in which is a loosely fitted split pin, seemingly serving no purpose. In fact, this split pin (part no. PC39) is sitting in a drainage hole, and its mere presence dangling in the hole helps oil or water which may have found its way into the bell housing to drain out again, thus avoiding fluid build up in the environs of the clutch. Omit the split pin and the hole, devoid of the rattling bit which kept it clear, will quickly block up and fail to serve its purpose.

Interchangeability of gearboxes

It would seem to be fairly easy to source a replacement gearbox for a Midget 1500cc from one of several other British Leyland motor cars produced in the 1970's. Unfortunately there are sufficient detail differences between the Midget 1500cc gearbox and the visually similar Morris Marina and Triumph Spitfire units (and any other members of that gearbox family, known as the Triumph 'single rail' gearbox) to make interchangeability too much of a headache.

Unless transmission tunnel modifications and propshaft shortening are amongst your skills, don't contemplate trying to fit a Spitfire overdrive gearbox either, nice idea that it may seem. It must be admitted, however, that the Midget 1500cc is very well suited to higher gearing (it has more torque than its 1275cc predecessors), becoming endowed with a much more comfortable cruising ability; this statement is verified by the fact that from 1978 all Midget 1500cc's were fitted with a higher 3.7:1 differential - previously a 3.9:1 unit was used, and before that 4.2:1 on very early 1275cc's. Earlier 1500cc's would benefit greatly from the fitment of the 3.7:1 final drive, and unlike an overdrive gearbox conversion, the task of swapping differentials would be a relatively simple one. The only hang up would be in either getting the speedometer recalibrated or exchanging it for another instrument displaying the correct TPM (turns per mile) rating on its face.

Splitting the gearbox from the engine

It is, for a start, considerably easier to remove the engine and gearbox as one from the car. Having done so, make sure that the gearbox is supported adequately while the nuts and bolts holding it to the engine back plate are removed. Failure to do so will stress the mounting flange on the bell housing local to the remaining nuts and bolts as others are removed (if you're really unlucky, the flange may even crack there and then). Once all the fasteners have been removed, the gearbox should still be carefully supported until it has been moved away from the engine.

The gearbox (which is fairly heavy) will otherwise be held in the air by its input shaft, this in turn will be cantilevering from the end of the crankshaft, damaging bearings, the front cover seal or even the shaft itself.

Internal Gearbox 1500cc (1975-79)

Internal Gearbox 1500cc (All G-AN6 models)

Note: Please see the Accessories section for performance parts.

ill.	Part Number	Price £ea.	Description	Req.	Details
1	DAM1005	NCA	CONSTANT PINION SHAFT* (1st motion shaft).	1	to gearbox 59162 and from 60001 to 65224
	DAM2818	NCA	CONSTANT PINION SHAFT* (1st motion shaft).	1	

*Note: The constant pinion shaft DAM1005 uses a scroll between itself and the front cover to prevent oil loss from the gearbox. Shaft no. DAM2818 however employs a rubber lip oil seal for the same purpose; the oil seal is housed in a different design of front cover. Care must be taken when ordering replacement parts for this area of the gearbox, since front covers and constant pinion shafts cannot be interchanged. For details of the front cover assemblies, please see pages 144. When reassembling a gearbox which has the rubber oil seal design, ensure that the splines on the constant pinion shaft are

completely covered in adhesive tape before fitting the cover and shaft together. This will guarantee that the delicate lip on the rubber seal is not damaged by the passage of the splines.

2	106365	NCA	OIL THROWER	1	
3	104433	£12.50	BEARING, front main	1	
4	112654	NCA	CIRCLIP	1

22	DAM3908		NCA SPACER	1	
23	150328	£9.00	BAULK RING, 4th gear	1	
24	156968	£84.00	SYNCHRO HUB	1	3rd/4th gears
25	037948	£0.40	SHIM, (under synchro spring)*	a/r	

*Note: This shim is selectively fitted under each of the springs and balls in the two synchro hubs in the gearbox. Its use is to equalise the outward pressure of the balls in the hub. Equalising the pressure can only be achieved with special spring balance equipment, so it only remains to be said that if you have to take a hub apart for inspection or cleaning, make sure (by means of scribing identifying marks on non-working surfaces of the gear) that the correct shims go back in their respective holes.

Along the same lines as the above, use corresponding scribed marks on the hub and outer ring to ensure that the ring is slipped back in place exactly as it was before (and the same way round!).

26	104445	£0.24	SPRING, in synchro hub	3	
27	BLS108	£0.29	BALL, in synchro hub	3	
28	150328	£9.00	BAULK RING, 3rd gear	1	
29	TKC6444	£1.03	CIRCLIP, mainshaft	1	
30	159978		NCA THRUST WASHER	1	
31	22G1643		NCA GEAR, 3rd speed	1	
32	147354	£17.65	BUSH, 2nd and 3rd gear	2	
33	111422		NCA WASHER, thrust, 0.153"	a/r	
	149963	£0.68	WASHER, thrust, 0.157"	a/r	
	131843		NCA WASHER, thrust, 0.162"	a/r	
	156084		NCA WASHER, thrust, 0.166"	a/r	
	UKC769		NCA WASHER, thrust, 0.170"	a/r	
34	22G1816		NCA GEAR, 2nd speed	1	
35	106262		NCA WASHER, 2nd gear	1	
36	150328	£9.00	BAULK RING, 2nd gear	1	
37	156911WO	£85.36	SYNCHRO HUB, 1st/2nd gear*	1	to gearbox 241363
	DAM6828SR		NCA SYNCHRO HUB, 1st/2nd gear*	1	from gearbox 241364

*Note: It may be seen from scanning the remarks column on this page that the 1st/2nd gear synchro assembly, laygear and reverse idler all changed in specification at the same time. This means that the only way of converting one of these components in your gearbox to the alternative specification is to replace all three.

Bear in mind the relatively high cost before embarking on this route. When the 'matter of course' replacement bearings, thrust washers and the sundry components required to reassemble the gearbox are also taken into account, it's almost certain that it will be more economical to opt instead for a good quality reconditioned exchange gearbox (see 'Assessment for Overhaul' on this page).

38	037948	£0.40	SHIM, in synchro hub	a/r	
39	106388	£0.76	SPRING, synchro	3	
40	BLS108	£0.29	BALL, in hub	3	
41	150328	£9.00	BAULK RING, 1st gear	1	
42	137834	£4.06	SPLIT COLLAR	2	
43	22G1641	£64.00	GEAR, 1st speed	1	
44	144595	£28.00	LAYSHAFT	1	
45	DS1908	£0.31	ROLL PIN	1	
46	137532	£0.35	SPRING*	3	

*Note: These springs control the end float of the laygear on its shaft, by pushing the front thrust washer against the laygear. Placing the springs in their respective holes in the gear case is the last job to be done prior to refitting the bell housing; it's very easy to forget them. Be warned).

47	113229	£4.30	THRUST WASHER, front	1	
48	119893	£0.43	NEEDLE ROLLER, front	25

60	CHM63		NCA REVERSE LEVER	1	
61	DAM1714		NCA REVERSE LEVER PIVOT PIN	1	

Assessment for Overhaul

Oil in any machinery collects particles from the operating parts it comes into contact with. Many engineering concerns use lubricating oil analysis at regular intervals to monitor the machinery's

condition. In fact, with the oil laboratory's help and the applied knowledge of the mechanical engineer, machinery life expectancy and time period between overhauls can be established. Economically speaking, a piece of machinery can be withdrawn from service for bearing replacement before it actually fails and destroys other more expensive parts within the whole.

This, in the case of an aircraft engine for example, will minimise in-service break downs and unscheduled power plant changes. Some motor car oil manufacturers offer lubricant analysis to users of their product.

Impending failures can be noted by increases of certain deposits in the analysed oil. The oil drained from your gearbox can be viewed in a less scientific manner, but still with an accent towards indicating any potential failure, or to give an idea of which item has failed within the gearbox and how it has failed. A damaged component such as a synchro ring may prove relatively cheap to replace. The complete collapse of the mainshaft tip bearing or layshaft needle roller bearings is not. A magnetic drain plug in the sump of the gearbox is recommended, as it will collect all the metallic particles that otherwise would circulate with the oil and further erode the wearing surfaces of all components.

So what do you look for in your oil when you have drained it into a clean container? A light brassy 'coloured' oil is nothing to worry about. However, brassy coloured lumps or pieces of yellow coloured metal indicates the failure of synchro rings, the plain bushes on the mainshaft or the thrust washers at each end of the laygear countershaft.

A thick grey coloured oil will indicate the start of or the actual failure of steel components such as the laygear bearings, or the mainshaft tip bearing in the first motion shaft. This coloured deposit can be tested with a magnet; steel fragments will of course be attracted to it.

If the reason you have drained your oil is because of a nasty noise from the gearbox when it is driven, this information may assist you in planning the repair route you choose. Once the gearbox is removed from the car, the exterior of the gearbox should be cleaned. It is important that no extra dirt be deposited inside the gearbox while an internal examination is carried out through the removed top cover. Physically moving parts about and checking for excessive play in bearings will give a good indication whether it is cheaper to 'chop the box in' for a reconditioned item, or tackle the repair yourself. Often it is cheaper to tackle the task yourself.

As with all things in life you get what you pay for. A cheap reconditioned exchange gearbox is not necessarily as good as your own with the same amount spent on spares. This said, if you are expecting to have to renew gear assemblies or sets of gears it may well prove economically more prudent to obtain a quality reconditioned exchange unit. Often, when gear set and shaft replacement is required the sum of the cost of the parts far exceeds the cost of the whole. The quality gearbox repairer knows what goes wrong and will replace items regardless of their condition, as he has to guarantee the finished unit. Similarly an experienced re-conditioner will have spares available to himself which are not always obtainable by the public. This is his trade and he will protect it to retain his position in the marketplace.

When fitting a reconditioned exchange gearbox assembly do not forget that the unit is delivered without lubricating oil. The oil recommended is Hypoid 90 grade, as used in the rear axle assembly. A gearbox from dry requires approximately 1 1/2 pints (0.85 litres) of such oil.

As a useful tip, remember to slacken both the oil drain plug and filler plug prior to installation of the unit in the car. There is nothing more irritating than wanting to fill (or drain) a gearbox and then discovering that the plugs on the freshly fitted and now inaccessible unit were apparently installed by the world's strongest man! Afterwards, re-tighten both plugs to your chosen torque.

Fuel Tank, Pipes & Pumps

Fuel Tank

Note: Please see the Accessories section for performance fuel pumps.

83	12H1001SS	£2.50	CLIP, (hose to carburettor)	2	upper mounting stud
84	HMP215007	£0.82	FERRULE, hose to hose clip	2	

Fumes & Mess in The Boot

It's a common scenario; there's a dark sticky mess in the dip at the back edge of the boot floor, a constant whiff of stale petrol every time the boot is opened, and yet you've already tightened the clips on the fuel filler hose (that's the only place it could be leaking from, isn't it?). The likelihood is that the fuel tank has a rust hole near the filler neck, the foam seal around which is busy soaking up escaping petrol and dribbling it from the hole in the boot floor, through which it just protrudes. Carefully coax off the rusty nuts and studs holding the tank to remove it (unless whoever last fitted it thoughtfully greased them). It's an easy decision:

If the tank is perforated in one place, it's about to do the same elsewhere and needs replacing, not repairing. When you fit a new tank, apply rust inhibitor to the top surface first, especially around the neck. Don't forget the rubber strips which prevent the tank chafing on the boot floor (to stop a repeat performance in future). See our website for Fuel tank Treatment products.

**Fuel Pump (Mechanical) 1500cc**

(G-AN6)

There were two types of fuel pump used on the Midget 1500cc, the earlier style (used on engines up to engine no. FP50967) mounted via a gasket on the engine block, with 11/4" long studs - the later pump (engine no. FP50968 onwards) mounted on a 1/2" thick spacer block and used 13/4" long studs. The pumps may only be interchanged if used with their corresponding mounting hardware.

115	RKC1624Z	£18.80	FUEL PUMP	1	
116	TE605105	£1.50	STUD, 11/4" long, pump to engine block	2	to engine FP50967
117	GHF201	£0.08	NUT	2	
118	GHF332	£0.20	WASHER, locking	2

HS2 SU Carburettors 1275cc (1967-74)

Note: Please see the Accessories section for performance carburettors.

Carburettors 1275cc (SU type HS2)

Your carburettors can be identified by the number on the aluminium tag attached to one of the float chamber lid screws. The number, suffixed by 'R' or 'F' (rear or front carburettor), will be AUD136, AUD327 or AUD662T. If the tag numbers are missing or illegible, the following features will help to determine the specification of your carburettors:

ill.	Part Number	Price £ea.	Description	Req.	Details
1	AUD136T	£531.00	CARBURETTORS, HS2, pair, new	1	12CC engine
	AUD136E	£314.80	CARBURETTORS, HS2, pair, recon	1	
	AUD327T	£519.00	CARBURETTORS, HS2, pair, new	1	12CE, 12V586F &
	AUD327E	NCA	CARBURETTORS, HS2, pair, recon	1	12V588F engines
	AUD662T	£596.00	CARBURETTORS, HS2, pair, new	1	12V778F engines
	AUD662E	NCA	CARBURETTORS, HS2, pair, recon	1	
2	AUD9181	£169.20	SUCTION CHAMBER & PISTON	2	AUD136 & AUD327
3	AUC8114A	£14.80	DAMPER PISTON ASSEMBLY	2	carburettors
	AUD9998	NCA	SUCTION CHAMBER & PISTON	2	AUD662T carburettors
	AUC8103A	£14.80	DAMPER PISTON ASSEMBLY	2	
4	AUC2141	£0.40	WASHER, fibre	2	If required
5	JZX1394	£0.50	SCREW, chamber to body	6	
6	AUD1242	£9.50	NEEDLE, type H6, (rich)	2	
	AUD1478	£9.50	NEEDLE, type AN, (standard)	2	AUD136 and AUD327
	AUD1211	£9.50	NEEDLE, type GG, (lean)	2	carburettors
7	AUC2057	£1.33	SCREW, needle securing	2	
8	CUD1002	£10.20	NEEDLE, type AAC	2	
9	AUD3306	£0.59	SPRING	2	AUD662T carburettors
10	AUD4288	£7.18	NEEDLE GUIDE	2	
11	AUD4250	£2.35	SCREW, needle guide securing	2	
12	WZX1259	£7.22	PISTON GUIDE & SCREW KIT	2	
14	WZX1108	£6.00	PISTON LIFTING PIN KIT	2	'tickler pin'
15	AUC1151	£0.78	SPRING	2	
16	AUD4150	£0.78	CIRCLIP, pin securing	4	
17	AUC4587	£3.50	PISTON SPRING, blue, 2 1/2 oz.	2	
20	WZX1442	£16.00	JET BEARING KIT	2	
21	AUC2002	£4.26	TUBE NUT, jet securing	2	
22	AUC2114	£1.64	SPRING	2	
23	AUC8461	£1.55	TUBE NUT, mixture adjustment	2	
24	AUD2987	£3.44	WASHER, sealing, jet bearing	2	
25	AUD9141A	£20.00	JET ASSEMBLY, front, 0.090" jet	1	
	AUD9142A	£20.00	JET ASSEMBLY, rear, 0.090" jet	1	
26	AUD2129	£2.45	TUBE NUT, jet to float chamber	2	
27	AUD2193	£0.29	WASHER, seal supporting	2	
28	AUD2194	£0.98	SEAL, rubber	2	
29	AUD2195	£1.24	FERRULE, brass	2	
30	AUC2104	NCA	SCREW, jet to lever	2	
35	AUD2140	£71.90	FLOAT CHAMBER	2	
36	AUD2677	£5.70	ADAPTOR, float chamber, front	1	
	AUD2676	£5.70	ADAPTOR, float chamber, rear	1	
37	AUC1329	£2.65	WASHER, support	2	
38	AUD2891	£9.67	BOLT, flanged head, float chamber	2	
	AUD3017	£2.70	BOLT, to mount float chamber	2	alternative to AUD2891
	AUC1317	£0.55	WASHER, plain	2	
39	AUC1318	£2.50	WASHER, rubber	2	
40	WZX1300	£9.60	FLOAT	2	includes gasket item 41
41	AUC8459A	£1.00	GASKET, float chamber lid	2	
42	WZX1101A	£9.00	NEEDLE & SEAT	2	includes gasket item 41
	GAC9201X	£9.50	GROSE JET, (superior valve design)	2	alternative to WZX11001A
43	AUC1152	£0.60	PIN, float pivot	2	
44	AUE269	£42.50	FLOAT LID, front	1	
	AUE266	£49.50	FLOAT LID, rear	1	

Note: Float lid kits contain items 40, 42 & 43.

45	JZX1394	£0.50	SCREW, float lid	6
46	WL700101	£0.14	WASHER, locking	6
47	AUC1215	£1.03	BAFFLE, float lid	2
50	37H3043	NCA	STEEL INSERT, (throttle shaft bush)	a/r
51	WZX1310	£9.80	THROTTLE SPINDLE KIT	2

Note: Spindle kit includes items 52, 58, 80 & 81.

52	AUC1358	£0.72	SCREW, throttle disc to spindle	4
53	WZX1320	£16.10	THROTTLE DISC KIT, plain disc	2

Note: Disc kit includes items 52, 80 & 81.

54	AUC1145	NCA	THROTTLE LEVER, front	1
	AUD2101	NCA	THROTTLE LEVER, rear	1
	WZX1140	£6.16	THROTTLE LINKAGE SUNDRIES KIT	2

Note: Sundries kit includes items 55, 56, 60 & 61.

55	AUC3464	£0.80	SCREW, fast idle adjustment	2
56	AUC2451	£0.94	SPRING	2
57	JZX1328	£7.93	LEVER, lost motion	2
58	AUD3323	£0.44	LOCK TAB	2
59	AUC1424	£2.15	PIVOT NUT	2
60	AUC3464	£0.80	SCREW, (throttle stop & idle adjustment)	2
61	AUC2451	£0.94	SPRING	2
62	WZX1336	£6.50	CHOKE SPRING KIT, front carburettor	1
	WZX1335	£6.50	CHOKE SPRING KIT, rear carburettor	1
66	AUD9004	£13.45	LEVER & JET LINK, front	1
	AUD9005	NCA	LEVER & JET LINK, rear	1
	CUD2686	NCA	LEVER & JET LINK, front	1
	CUD2687	NCA	LEVER & JET LINK, rear	1
67	WZX1331	£20.40	PIVOT BOLT KIT	2
68	AUC1426	£9.37	BOLT, pivot	2
69	AUD2429	NCA	WASHER, anti rattle	2
70	AUC5032	£1.75	WASHER, spacing	2
71	AUC8473	£1.33	DISTANCE TUBE, inner	2
72	AUD2430	£2.54	DISTANCE TUBE, outer	2
73	AUD2433	£0.44	WASHER, spacing	2
74	AUC8456	NCA	CHOKE LEVER, front	1
	AUC1371	£5.70	CHOKE LEVER, rear	1
	AUD4410	NCA	CHOKE LEVER, front	1
	AUD4411	NCA	CHOKE LEVER, rear	1
80	ACA8014	£0.40	GASKET, carburettor to air filter	4
81	1G2624	£0.41	GASKET	6

Note: For insulating blocks & heat shield, see Manifolds & Air Cleaners on page 156.

82	GHF202	£0.14	NUT, securing carburettor to manifold	4
83	GHF333	£0.20	WASHER, locking	4
90	AEA597	£10.30	LINK ROD & LEVER, throttle	1
91	AUC1457	£2.65	LINK ROD, choke	1
92	AUE587	£2.50	LOST MOTION LEVER ASSEMBLY	2 rear
93	AUE586	£2.50	LOST MOTION LEVER ASSEMBLY	2 front
94	AUC2694	£0.55	SCREW, (in lever)	4
95	AUC8396	£0.40	WASHER, plain	4
96	AJD8012Z	£0.20	NUT	4
97	ACC5062	£1.75	TRUNNION, accelerator cable	1
98	PWZ203	£0.12	WASHER, plain	1
99	GHF502	£0.14	SPLIT PIN	1
100	GHF300	£0.14	WASHER, plain, (cable locking)	1
101	GHF200	£0.14	NUT, (cable locking)	1
102	AUE34	£1.80	TRUNNION, (choke cable)	1
	GGL1011	£6.00	SPRAY CLEANER	a/r
	AUE810A	£3.71	GASKET KIT	2
			(Kit includes items 24, 27, 28, 41, 80, 81).	
	WZX1391	£6.70	FLOAT CHAMBER SUNDRIES KIT	2
			(Kit includes items 27, 28, 37, 41, 43, 45, 46, 47).	
	WZX1859X	£54.00	SERVICE KIT	1
			(Kit includes items 3, 25, 41, 42, 80, 81).	
	CRK101	£87.10	REBUILD KIT	1
			(Kit includes items 3, 25, 41, 42, 50, 51, 52, 53, 80, 81).	

The Right Tools For The Job

If you have ever noticed how difficult it is to find a spanner short enough, yet with jaws wide enough, to adjust the jet nut under the carburettor, then take heart from the knowledge that SU identified the problem and came up with a special spanner, AUD2693, for the task. While being short to allow sufficient clearance to rotate it under the carburettor, there is still enough leverage available through the handle for controlled, gentle movement of the jet nut. You may not need it now, but you'll certainly be glad of it when the occasion arises. Please see our website or Restoration Tools catalogue for full range of tools & workshop equipment.

105	AUD2693	£2.68	SPANNER, jet adjusting	1
-----	---------	-------	------------------------	---

HS4 SU Carburettors 1500cc (1975-79)

Carburettors 1500cc (SU type HS4)

The carburettors fitted to Midget 1500cc's follow the same evolutionary changes as those fitted concurrently to the cars' stable-mate, the Spitfire 1500cc's. Unfortunately the change points are not really documented adequately for the Midget, so only very approximate dates can be given to show when the changes occurred (by working the dates out from the more concise Spitfire documentation). The best way to identify your carburettors, therefore, is to read the number on the aluminium tag attached to one of the float chamber lid screws. The number, suffixed by 'R' or 'F' (rear or front carburettor), will be AUD665, FZX1258, FZX1122 or FZX1327. If the tag numbers are missing or illegible, the following features may help identification of your carburettors:

AUD665	Flat damper piston cap (see item 2), with plain jets (see item 27)
FZX1258	Flat damper piston cap (see item 2), with 'Waxstat' (see item 28)
FZX1122	Raised damper piston cap (see item 6) 'LZX1313' moulded into cap, with 'Waxstat' jets (see item 28)
FZX1327	Raised damper piston cap (see item 6) 'LZX1506' moulded into cap, with 'Waxstat' jets (see item 28)

These original carburettor types have been replaced with items detailed below:

AUD665	1975 & early 1976 cars	Use AUD665T
FZX1258	Late 1976 & 1977 cars	Use AUD665T
FZX1122	1978 & most 1979 cars	Use FZX1327T
FZX1327	Very last 1979 cars	Use FZX1327T

ill.	Part Number	Price £ea.	Description	Req.	Details
1	AUD665T	£672.00	CARBURETTORS, HS4, new, pair (Supplied with plain jets).	1	
	FZX1327T	£647.00	CARBURETTORS, HS4, new, pair (Supplied with 'Waxstat' jets).	1	
2	LZX1968	NCA	SUCTION CHAMBER & PISTON	2	for AUD665 and FZX1258 carburettors
3	AUC8114A	£14.80	DAMPER PISTON	2	
4	AUC2141	£0.40	WASHER, fibre	2	'sliding bush' type
5	AUC4387	£6.70	SPRING, red, 4 1/2 oz. (1" dia.)	2	suction chamber)
6	LZX1025	NCA	SUCTION CHAMBER & PISTON	1	for FZX1122 carbs ('ball
7	LZX1313	NCA	DAMPER PISTON	1	bearing' suction chamber)
	LZX1523	NCA	SUCTION CHAMBER & PISTON	1	for FZX1327 carbs ('ball
	LZX1506	NCA	DAMPER PISTON	1	bearing' suction chamber)
8	AUD4355	£3.71	SPRING, red, 4 1/2 oz. (2 1/4" dia.)	1	for FZX1122 & FZX1327 carbs

	WZX1443	£15.50	JET BEARING KIT	2	for FZX1258, FZX1122 & FZX1327 carburettors

21	AUC8478	£0.98	WASHER, sealing, jet bearing	2	
25	AUD2104	£0.35	SCREW, jet to bracket	2	
26	AUD2427	NCA	BRACKET, jet to lever, front	1	for AUD665 carburettors (standard jets)
	AUD2428	£0.98	BRACKET, jet to lever, rear	1	
27	AUD9451A	£21.40	JET ASSEMBLY, front, (0.090"), jet	1	for AUD665 carburettors (standard jets)
	AUD9450A	£21.40	JET ASSEMBLY, rear, (0.090"), jet	1	
28	LZX1323A	£42.50	JET ASSEMBLY, front, (0.090"), jet	1	for FZX1258 carburettors (capstat jets)
	LZX1322A	£42.50	JET ASSEMBLY, rear, (0.090"), jet	1	
	LZX1331	£39.50	JET ASSEMBLY, front, (0.090"), jet	1	for FZX1122 and FZX1327 carburettors, (capstat jets)
	LZX1330	£39.50	JET ASSEMBLY, rear, (0.090"), jet	1	
29	AUD2129	£2.45	TUBE NUT, jet to float chamber	2	
30	AUD2193	£0.29	WASHER, (seal supporting)	2	
31	AUD2194	£0.98	SEAL, rubber	2	
32	AUD2195	£1.24	FERRULE, brass	2	
34	TT1459	£67.20	JET CONVERSION KIT	1	converts capstat jets to standard jets

Note: If your car has Capstat type carburettors (FZX1258, FZX1122 or FZX1327) then read on. It's possible that your engine - when hot, dies on idle, or idles unevenly. If these maladies can be definitely traced back to the carburettors, our TT1459 'Capstat' conversion kit can be fitted. The kit replaces the dubious Capstat jets with standard items and also effects the necessary choke linkage changes. One kit services both carburettors.

35	AUC2140	NCA	FLOAT CHAMBER	2	
36	AUD2178	£10.00	ADAPTOR, float chamber, front	1	
	AUD2179	£10.00	ADAPTOR, float chamber, rear	1	
37	AUC1329	£2.65	WASHER, support	2	
38	AUD2891	£9.67	BOLT, flanged head	2	float chamber alternative to item 38

58	RFN303	£0.50	GROMMET	1	choke cable through bulkhead

Sticking Throttle?

Once you have lubricated the throttle pedal pivot and carburettor linkage, oiled the dashpots, then checked to make sure that the return springs are still where they should be and have not broken, you will have whittled away the possible causes of a sticking throttle to leave just two: a sticking carburettor (due to jet misalignment, ingress of dirt, etc.) or the throttle cable. The second of these is the more likely and may come about in one of the following manners. The inner cable may be frayed, the debris from which is inhibiting the inner cable's movement in side the outer cable or sheath. If this is the case, the cable is undoubtedly on the way out and needs replacement. Corrosion may have taken place or somehow foreign matter may have got inside the outer cable; either of these require the same cure - a good clean and lubrication. A kink or too tight a curve in the route of the cable will also cause sticking; re-routing the cable is an easy enough task, but a kinked cable may prove to be the better of you. One last reason for a sticking cable is a damaged or missing earth lead from the engine to the chassis; the engine is obviously insulated from the chassis by its rubber mountings, so if it cannot earth itself through the braided earth lead, it will try to find another way. The easiest route is through the throttle cable, this item is not substantial enough to take the load and will heat up, expand and partly or completely seize itself. In extreme circumstances, the outer and inner cables may become welded together. Incidentally, another route taken by the electricity may be the fuel supply pipe(!), so if an errant earth lead is suspected, sort it out immediately. Finally, if the cable isn't the cause of your sticking throttle, you are probably about to indulge in some patient, careful fiddling with the carburettors. Good luck.

Cable End Maintenance

Everybody who has ever tried to 'rethread' a pre-used multi-strand throttle or choke cable into its attachment on the carburettor linkage will know how difficult it is, as the previously clamped and distorted strands of wire unravel themselves. There's always one strand which won't go through the hole! A simple remedy is at hand. Having trimmed the end of the cable (check that by so doing you are not over shortening it) with suitable high grade cutters, take your flux, solder and soldering iron and lightly 'tin' the last inch or so of the cable. Running just enough solder into the strands will hold them together quite permanently.

Emission Controls 1275cc (1967 to mid-1968)
(All 12CC engine nos.; 12CE/Da/H101 to 3200, plus 3301 to 3400)

60	BAU5065M	£10.30	HOSE, breather	1	(Timing cover separator to breather control valve).
61	GHC11022	£1.94	CLIP, hose to separator & valve	2	
62	13H5191	£52.50	VALVE ASSEMBLY, breather control	1	
63	27H7760	£1.55	CLIP, cover	1	
64	27H7756	NCA	SPRING	1	
66	149342	£4.40	PLUNGER SUB-ASSEMBLY	1

68	27H7759	£3.96	COVER	1	
69	12G1654	£3.44	SUPPORT BRACKET, valve to manifold	1	
70	GHF117	£0.20	SCREW, valve to support bracket	1	
71	GHF331	£0.12	WASHER, locking	1	
72	GHF200	£0.14	NUT	1	
73	SH504051	£0.25	SCREW, (support bracket to manifold)	1	

74	GHF331	£0.12	WASHER, locking	1	
75	12H1407	£1.40	HOSE, valve to adaptor	1	
76	GHC11022	£1.94	CLIP, hose to valve & adaptor	2	
77	12H1405	£7.48	ADAPTOR, hose to manifold	1	
78	1B3664	£0.29	WASHER, sealing	1	

Emission Controls 1275cc (mid-1968 to 1974)
(12CE/Da/H3201 to 3300, plus 3401 onwards; all 12V engine nos.)

80	BAU5065M	£10.30	HOSE, breather	1	timing cover separator to 'Y' piece
81	GHC11022	£1.94	CLIP, hose to separator & 'Y' piece	2	
82	12G2134	£2.50	'Y' PIECE	1	
83	LLH10056	£2.30	HOSE, breather	2	'Y' piece to carburettor
84	GGT1117X	£1.24	CLIP	4	hose to 'Y' piece & carb

Emission Controls 1500cc
(G-AN6)

90	154220	£1.40	HOSE, breather	1	rocker cover to 'T' piece
91	UAM1600	£5.05	'T' PIECE	1	
92	154935	£5.00	HOSE, breather	2	'T' piece to carburettor
93	154934	£1.40	ADAPTOR	2	breather hose to carb

Breathing Problems

An engine needs to breathe, not just through the cylinder head ports, but also from the block. A certain amount of gas compression will always reach the lower part of the block through various routes; on older cars this undesirable pressure build up was dispensed with through a pipe which simply vented to the atmosphere underneath the car. By the mid 1960's, however, it was becoming recognised that obnoxious mixtures and fumes really shouldn't be simply let loose, the easiest method of containing them being to recycle them through the induction system. This could also provide the added bonus of helping to pre-heat the fuel/air charge, just as it entered the engine. Several different methods of closed circuit breathing were designed, essentially two of which are itemised above. It is necessary to keep the breathing system operational, if for no other reason than to stop oil leaks from engine seals when the crankcase pressure becomes too great.

Periodically, breather hoses should be checked for blockages - usually in the form of a black congealed mixture of carbon deposits and oil. The same may be said for any filters or separators in the system, for example the separator 'can' on the timing cover of 1275cc engines and also the oil filler cap on the same engine (the oil filler cap is also a gauze filter-filled venting device, which is why it should be changed every 12,000 miles).

Finally, and contrary to the statement above on the 1275cc unit, the 1500cc engine should not vent through the filler cap: this would amount directly to an air leak in the induction system, resulting in rough running or at worst an uncontrollable throttle (and/or melted exhaust valves!). Take care to only fit the correct non-vented filler cap (part nos. GZC1400). If you wish to replace the rocker cover on your 1500cc engine with an alloy equivalent, make sure before you buy it that it is either supplied with, or capable of taking a non-vented cap.

Kangaroo Petrol - or Worse ?

A worried Scandinavian owner rang his UK based parts specialist one day with the complaint that he could not drive his car slowly over the bumpy woodland roads typical of his country without it behaving 'like it was a kangaroo'. He had done everything to his car including fitting stronger front road springs and harder dampers in a vain attempt to relieve the problem. It was eventually solved by the use of a pair of new carburettor throttle return springs to replace very tired old ones. Every time he had driven over a bump, his foot had pushed down on a very light throttle pedal; he reacted by lifting his foot, the car slowed down and he instinctively pressed the accelerator down, whereupon the whole disconcerting process began again. Increasing the pedal pressure of the accelerator by fitting new return springs was just enough, as the car's designers had intended, to damp out the see-saw effect and resolve the owner's 'kangaroo petrol' problem.

Incidentally, tired engine mountings which allow the engine to rock sideways excessively under acceleration or braking will cause the throttle cable to tighten or slacken off, resulting in similar staccato progress down the road (although not so marked as that caused by a 'soft pedal').

Manifolds & Air Cleaners

Manifolds 1275cc
(All G-AN4, G-AN5, H-AN9, H-AN10 and A-AN10 models)

Note: Please see the Accessories section for performance parts.

ill.	Part Number	Price £ea.	Description	Req.	Details
1	AJM601	£1.94	GASKET, manifolds	1	
2	GHF261	£0.35	NUT, brass, (manifolds to head)	6	
3	GHF301	£0.13	WASHER, plain	2	exhaust manifold to head
4	12A1211	£0.65	WASHER, manifolds to head	4	
10	AUE1020	£158.00	MANIFOLD, inlet*	1	

(*With tapped boss for closed circuit breather control valve).

Under Bonnet Decals

In many sections of this catalogue may be found information on engraved or printed plates and decals applied to components and cars when they were manufactured. As a delightful finishing touch to a painstaking restoration they are unsurpassed; much research has been put in by the people who now reproduce these items to ensure total accuracy. With MG & Austin Healey being amongst the most comprehensively served marques in the classic car parts market place, just about every decal or plate your car was fitted with has now been reproduced - for example, the 'Coopers' transfers and decals for 1275cc air cleaner assemblies.

CRTR202A	£3.10	TRANSFER, 'Coopers', front air box	1	
CRTR202B	£2.10	TRANSFER, 'Coopers', rear air box	1	(To approx. 1971)
CRST119	£1.10	DECAL, 'Unipart', (both air boxes)	2	(From approx. 1971)

Manifolds 1500cc

(All G-AN6 models)

101	AJM681	£5.18	GASKET, manifolds	1	
102	DS2512	NCA	ROLL PIN, (locating inlet manifold)	2

			(*Note: Does not require gaskets).		
	UKC8372SS	£25.00	HEAT SHIELD, carburettors, s/steel	1	from mid 1977
146	UKC2992	£0.78	GASKET (Carb to heat shield and heat shield to manifold).	4	for original heat shield

Using Sports Air Filters & Exhausts

In the Accessories section you will find K&N Sports air filters & Sports Exhausts that are intended to provide easy, cost effective improvements to the performance of your car. The accent is on 'intended', because on a large number of vehicles so fitted, the only positive improvement is to the appearance of the engine bay. In fact, if the knock on effects of these potentially more efficient parts have not been recognised and the appropriate steps taken, the result may be a car which doesn't 'go any faster' but uses more fuel and runs badly.

As any engine tuning guru will relate, the majority of modifications are based around the principle of increasing power by getting better gas flow through the engine; more fuel/air charge enters, while the exhaust gases can leave more easily, creating a better 'scavenge' effect to help to draw the new charge into the cylinders. Given better than standard gas flow through the use of (say) K&N air filters and maybe a tubular exhaust manifold, the carburettors will need tweaking to ensure that the fuel/air ratio of the charge remains correct. Potentially increased air flow into the system results in a need for a corresponding increase in fuel, otherwise the engine will run lean (causing poor economy, rough running or more detrimental effects on the pistons & valves).

In order to increase the fuel flow to match the air flow, simply winding down the jet nut on the carburettor by a few flats is usually not sufficient. A change of carburettor needle to one with a richer profile is required; only then can the fine adjustment be carried out on the carburettor to find its optimum setting. Suggestions for non-standard carburettor needles are given here (needles are sold individually, by the way, plus you will need to know on 1275cc cars whether your carburettors use fixed or biased/sprung needles). If you wish to experiment, the needle chart booklet (ALT9501), detailing the full range of SU needles and their profiles, would be very useful.

1275cc Models

Exhaust System

Type 1: 1275cc 'Single Box' System
RHD Specification, 1967-69, (G-AN4; H-AN9)

ill.	Part Number	Price £ea.	Description	Req.	Details
UK cars used a 'single box' system with flared front pipe from 1967-69 inclusive. However, a few cars in this period had the 'cross box' (Type 2) system, particularly near the end of 1969.					
1	GEX1306	£30.00	FRONT PIPE, mild steel	1	
	FSAN290	£44.50	FRONT PIPE, stainless steel	1	
2	GEX3365	£28.30	SILENCER, mild steel	1	
	FSAN233	£87.00	SILENCER, stainless steel	1	
3	GEX7153		NCA BRACKET, gearbox	1	
4	GEX7154	£1.24	STRAP, bracket to front pipe	1	
5	GEX7049	£2.65	CLAMP, manifold to front pipe	1	
6	GEX7072	£4.30	CLAMP, front pipe to strap	1	
7	GEX7073	£4.30	CLAMP, intermediate mounting	1	
8	GEX7074	£4.30	CLAMP, system joint	1	
9	GEX7155	£1.80	MOUNTING, intermediate	1	
10	AHC442	£0.66	WASHER, insulation	2	
11	GEX7151	£0.67	BUSH, rubber	2	
12	GEX7152	£0.98	DISTANCE TUBE	1	
13	SH605071	£0.46	SCREW, (5/16" UNF x 7/8")	4	
14	SH605101	£0.70	SCREW, (5/16" UNF x 1 1/4")	1	
15	SH605121	£0.85	SCREW, (5/16" UNF x 1 1/2")	1	
16	SH604071	£0.56	SCREW, (1/4" UNF x 7/8")	1	
17	GHF332	£0.20	WASHER, locking, (5/16")	5	
18	GHF331	£0.12	WASHER, locking, (1/4")	1	
19	PWZ205	£0.20	WASHER, plain, (5/16")	3	
20	GHF201	£0.08	NUT, (5/16" UNF)	3	
21	GHF200	£0.14	NUT, (1/4" UNF)	1	
22	GHF222	£0.50	NUT, nyloc, (5/16" UNF)	2	
23	HMP815003	£26.40	FITTING KIT, type 1 system	1	
			(Includes items: 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22).		

Type 2: 1275cc 'Cross Box' System
Non-North American LHD Specification, 1967-72 (G-AN4; up to G-AN5-139136; H-AN9)
RH Steering Specification, 1970-72 (G-AN5-74886 to 139136; H-AN10; A-AN10)

The 'cross box' system with flared front pipe to manifold joint was used on European cars between 1967 and 1972 inclusive (only Midgets from 1970, Sprite exports ceased in 1969). It was used on UK cars from 1970-72.

30	GEX1306	£30.00	FRONT PIPE, mild steel	1	
	FSAN290	£44.50	FRONT PIPE, stainless steel	1

56	GHF222	£0.50	NUT, nyloc, (5/16" UNF)	2	
57	HMP815004	£42.00	FITTING KIT, type 2 system	1	
			(Includes items: 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56)		

Type 3: 1275cc 'Cross Box' System
RHD and Non-North American LHD Specification, 1973-74 (G-AN5-139137 on)

This cross box system, only fitted to Midgets, used a three stud flanged manifold joint on the front pipe. Type 3 is available as a one piece exhaust system as well as components.

60	GEX142	£101.80	EXHAUST ASSEMBLY, mild steel	1	one piece system

	37H3651	£1.64	NIPPLE, chromed stainless	a/r	
23	AHA6664	NCA	CLAMP, spare wheel to boot floor	1	
24	AHA7373	£24.60	SPINNER, 2-eared, RH *	2	
	AHA7374	£24.60	SPINNER, 2-eared, LH *	2	
25	88G606	£22.50	SPINNER, octagonal, RH *	2	
	88G607	£22.50	SPINNER, octagonal, LH *	2	

*Note: Octagonal spinners were historically fitted to cars bound for market places where safety regulations stipulated that eared spinners could not be used. However, from the 1969 model year onwards, UK ('Home Market') cars were also fitted with them. A number of owners prefer the eared spinner to the octagonal type and retro-fit them to later cars; if you are thinking of doing the same, it is recommended that you consult your local legislations first, to ensure approval at the car's next roadworthiness test.

Tools

30	BHA5329	£91.70	JACK ASSEMBLY*	1	
----	---------	--------	----------------	---	--

*Note: The original sill jack (BHA4964) and ratchet handle (13H6692) are no longer available. Use BHA5329.

31	2A5626	£13.25	WHEEL BRACE	1	steel wheels only
32	11H1686	NCA	LEVER, hub cap, early wheels only	1	
33	C27290	£25.00	HAMMER, copper/hide	1	wire wheels only
34	AHH5839	£5.90	SPANNER, octagonal spinner	1	
35	GAC4089	£9.01	BRUSH, spoke cleaning	1	
36	MM385-800	£9.50	SPANNER, spoke adjusting*	1	
37	AHA5506	£35.00	TOOL BAG	1	
38	523638A	NCA	TYRE PUMP, period 'stirrup' type	1	

*Note: This wide-faced spanner is the correct size to turn tight spoke nipples without rounding them off, and the 7" length provides good leverage. Quality steel is used and the spanner is nicely plated, plus we guarantee it for life!

Jacking Up The Car

If there is any doubt concerning the structural rigidity of the bodywork close to the jacking point, do not use the side jack to raise the car. Apart from the safety aspect, the resultant distortions in the sill panel caused by the area above the jacking point hole taking the weight of the car will be most unsightly.

An alternative tool to keep in the boot for lifting the car is a scissor jack, which unlike most bottle jacks will fit under any part of the car you wish to raise. The best places to use a scissor jack are under one of the front chassis rails, or under the front mounting bracket of one of the rear springs. It would also help to have a pressed steel wheel chock to hand, as supplied in the tool kit of most British Leyland and Rover Group cars from the end of the 1970's onwards.

Wire Wheel Splines

If you run a wire wheel fitted car and under heavy acceleration or braking you can hear a sharp knock (rather like halves of coconut shells being clapped), either a spinner is slightly loose, or the splines holding a wheel to its hub are dry and need greasing. Before applying grease, inspect both the wheel and the hub; if the splines are sharp rather than having slightly radiused peaks, then the wheel or hub - preferably both - need replacing. Note that old wheel splines will quickly wear new hub splines and vice versa.

So You Think You've Got Wobbly Wire Wheels?

Back in the good old days when Pete Buckles and myself were just young lads, we were able to buy virtually direct from Dunlop, so the wire wheels were inexpensive. These British made wheels were sold mostly to the TR Register members at insanely low prices. 4.5" x 60 spoke wire wheels went out at £4.10.0d!, with no VAT to pay and we still made a pound on each wheel! The low prices enabled me to indulge in experiments: if they didn't work (or fit), offending wheels would always be 'sold on' and a couple of 'bob' profit could still be made.

Bear in mind that the wheel is capable of being flexed by 4"... It is then supposed to return to the original shape!

Checking vertical runout by spinning the wheel on a front hub

So my TR2, an attractive beast wearing glistening Midnight Blue paint work and not so glistening (but by then typical), rusty quarter panels, finalised its development with the unusual combination of 6" Cobra wheels at the front and, 5.5" TR6 wheels at the rear. This was because the TR2 was always enthusiastically driven and the growing pile of Lockheed half shafts finally stopped growing the day a second hand TR4 rear axle was installed, its extra width requiring the above wheel combination to balance its cornering habits.

Now, wire wheels are built to flex (or bend) and this was brought shockingly home to me on one occasion when Pete Buckles visited me in Birmingham (remember Clapgate Lane?). We were off to visit a supplier (who incidentally, still stamps out trunnion blanks for Moss). Pete's TR3 followed my TR2 down an interestingly twisty road which I happened to know particularly well, and after exiting a seriously exciting corner I looked in the mirror to check on the progress of our illustrious leader, and was horrified to see his car in a lurid slide (he maintained it was under control) with its outside front wheel keeling over at a crazy angle, almost 60 off vertical. This memory has remained vivid ever since, and is one explanation why Moss Europe (formerly Cox & Buckles) do not sell second hand or reconditioned wire wheels.

If it is assumed that both hub & rim of a wire wheel are in good condition, it may be worth having the wheel re-spoked 'as necessary' and then trued up by a competent re-builder. The wheel will probably need shot blasting and stove enamelling which will bring the cost to near to (or possibly over) the price of a new wheel. Remember also that you have got a used, worn wheel, not a nice new one. Bear in mind then, that the wheel is capable of being flexed by 4" (i.e., the hub is fixed and the top of the wheel is 4" further out than the bottom), while it is rotating at speed on the road, it is then supposed to return to the original shape. NOW decide if you still want the wheel re-built! We certainly would not want to guarantee one.

Slight sideways run-out (or 'out of true') with wire wheels is therefore not significant: a couple of hard corners will soon re-arrange the wheel spokes anyway. Vertical 'run out' should not be permitted, ever. By far the most common cause of wire wheel 'wobbles' is an incorrect method employed in balancing. A simple spirit level balancer is the thing to seek out. Under no circumstances should balancing be attempted on the now common dynamic machine without the use of the special sprung cones shown in the illustration, because, although the wheel locates correctly on its inner coned surface, these machines 'try' and locate onto the inside of the wire wheels outer flange, which is NOT a true machined surface. This incorrect technique appears as terrific sideways run-out and the balancing 'specialist' always blames the wheel. Now you know the truth.

It is always best to check the wire wheel by clamping it onto a front hub, using the correct knock-on nut BEFORE fitting the tyre. Spin the wheel on the hub and check sideways or vertical run-out as shown in the illustration, and observe or measure the run-out. + or - 1/16" is not a problem, even +/- 1/8" is barely detectable on the road.

So the conclusion is summarised as follows:

Our new wire wheels are built and assembled to the highest standards. When your wheel/tyre fitter says they are no good, there is a very, very strong chance that he is not using the equipment in a fashion which is appropriate for wire wheels. The above tips will allow you to check the 'truth' of the wire wheel, whether the wheel is new or used.

It's a sad truth that wire wheels have a bad reputation they don't deserve, but the people who give them a bad reputation actually deserve it themselves. We have total confidence in the Dunlop product we sell.

By Pete Cox

How To Balance Centre Lock Wire Wheels

We show here the advice given to tyre fitters, produced by Motor Wheel Services.

These notes are intended as a guide in helping to solve problems that are commonly encountered when balancing wire wheels on a electronic balancer.

Diagram A

Is the correct method of locating the wheel.

Diagram B

Shows the wrong method and one which gives false readings, giving the appearance of untrue or wheels that require large amounts of weights to balance the wheel.

Points To Check

- The original high degree of balance may be affected by wheel damage as well as by other factors related to the tyres uneven tread wear, cover or tube repairs.
- If vibration or high speed steering troubles develop, and this cause is not disclosed by mechanical investigation, then the complete tyre & wheel assembly should be checked for balance.
- It is **IMPERATIVE** that the hubs are located in the balancing machine in exactly the same manner as located on the car, and the factory truing jigs. Alternatively, balance on the vehicle, this operation can only be done on the front wheels.

Motor Wheel Services' dedicate considerable time to ensure that your wheels are of the highest quality & reliability. Following this guide, and the information contained in our centre-lock brochure will provide the highest level of customer satisfaction.

Brake Master Cylinder & Pedal

Brakes - An Introduction

Note: The changes wrought on the pedal box and brake master cylinder look complicated, but can reasonably be defined as follows.

On the previous 948cc & 1098cc Sprites and Midgets, a 'dual' cylinder supplied both the single line brake system and the clutch system. From the start of production of the 1275cc cars in 1967, new separate brake and clutch master cylinders were introduced (the brake master cylinder becomes 'Type 1' here), necessitating a new pedal box design. A short time later, the North American spec. cars were equipped with dual line brakes (a feature not to be found on UK and European cars until 1978), at this time they also acquired a mechanical brake light switch fitted in a hole in the pedal box (UK and European cars used a hydraulic brake light switch in the circuit).

Gradually the factory rationalised the pedal boxes, phasing out the non-pierced item and instead giving the UK & European cars the American pedal box with the hole blanked off with a plug. Upon introduction of the Midget 1500cc in 1975, the brake system was changed, the master cylinder remained the same but the hydraulic brake light switch was dropped in favour of the American-type mechanical switch (so the blanking plug was no longer required).

Brakes - An Introduction (Continued)

For a brief period in 1977-78 a brake master cylinder with a plastic remote reservoir was used ('Type 2'), necessitating a pedal box with a bracket to hold the reservoir. After this time dual line brakes were fitted to all Midget 1500cc's, using a new (in the UK and Europe) master cylinder with integral plastic reservoir ('Type 3').

Two other details should be mentioned here: Safety legislations in France and the 'Benelux' countries (Belgium, Netherlands, Luxembourg) required that the brake fluid level and condition be visible without having to remove the filler cap, for those specific markets a translucent plastic extension was screwed on to the top of a Type 1 master cylinder throughout sales of Sprites and Midgets to those countries. Also take note that while the Type 1 master cylinder was ostensibly the same from 1967 though to mid-1977, in fact the internal details were changed at G-AN6-169643 approx. in Midget 1500cc production, the later type, only identifiable by circular marks on the cylinder casting, was henceforth supplied as a service replacement for earlier cars. The moral is that replacing the master cylinder is easy, however if you intend to rebuild your old cylinder you must clearly establish which one you have before ordering components for it.

Brake Pedal & Pedal Box

The Incurable Rattle

Many owners of Sprites & Midgets other than post 1976 Midget 1500cc's will recognise the frustration of a light, metallic rattle from somewhere inside the back of the car, every time their car goes over a manhole cover or ridge in the road. Checked the boot lid stay? Yes. Was it loose? No. Something rolling around in the boot? No. Boot lid lock or striker not quite aligned? No. Exhaust mounting broken? No. Fuel or brake pipe come loose? No. Shock absorber bolt (or any suspension bolt) loose? Definitely not.

The answer lies with the hand brake mechanism!

The cross rods running from the centre of the rear axle out to the hand brake levers on the brakes are held by clevis pins and split pins. Excessive play is restricted by the use of two felt washers on each clevis pin. If there's a rattle at the back of the car that's difficult to trace, the odds are on some or all of the felt washers being missing. When lying under the car shaking the cross rods by hand, they don't make the right sound, a dull clunk rather than a sharp metallic rattle. The only way to be sure is to count the felt washers, any less than two per joint and you can be sure that's where the rattle is coming from.

Master Cylinders

Type 1: (G-AN4; G-AN5; to G-AN6-200000; H-AN9; H-AN10; A-AN10)

	GRK2014Z	£5.50	REPAIR KIT, (aftermarket)	2	
	GWC1129	£20.86	WHEEL CYLINDER	2	G-AN6
	GWC1129Z	£9.00	WHEEL CYLINDER, (aftermarket)	2	
	GRK2004Z	£5.50	REPAIR KIT	2	
52	513118A	£1.55	BLEED NIPPLE	2	
53	17H7949	£0.53	CIRCLIP*	2	wheel cyl. to back plate
54	37H4642	£0.82	GASKET	2	
55	17H7949T	£22.00	CIRCLIP FITTING TOOL, (2 piece)*	1	
56	17H7613	NCA	WASHER, 'belleville'*	2	
57	17H7622	£0.40	CIRCLIP, (wheel cylinder to back plate)*	2	

*Note: Originally a 'Belleville' washer (Part No; 17H7613) & external circlip (Part No; 17H7622) were used to secure the wheel cylinder. Later the wheel cylinder manufacturer (Lockheed) superseded this method to a three toothed circlip, this is the device supplied with the wheel cylinder today. It's a horror to fit (though, it gets easier with practice), so Lockheed made a special tool for the job. If you invest in the tool, you'll be glad to know you can lend it out (for a favour, naturally) to friends with Minis, MGB's, Triumph 2000's etc.- they all use the same circlip. Alternatively, you could buy the traditional hardware (items. 56 & 57) and banish installation problems altogether.

60	17H2824	£8.40	LEVER, handbrake, RH	1

Brake Pipes, Hoses & Fittings (Dual Line Systems)

Dual Line Brakes 1500cc
(G-AN6-212001 on)

Brake Pipes

Note: While the Midget 1500cc was manufactured (like its predecessors) in both RHD LHD versions, the latter were exclusively North American specification cars. This catalogue does not cover North American vehicles, if you require a brake pipe (or any other component) for a LHD Midget 1500cc, please telephone your nearest branch for details.

ill.	Part Number	Price £ea.	Description	Req.	Details
1	GAC5061	£65.70	BRAKE PIPE KIT, RHD	1	copper
2	GPP66AT	NCA	PIPE, front master cyl. outlet to PDWA valve	1	
3	GPP60AA	£13.55	PIPE, rear master cyl. outlet to PDWA valve	1	
4	GPP42CT	NCA	PIPE, PDWA valve to RH front brake hose		
5	GPP10CT	£10.18	PIPE, PDWA valve to LH front brake hose	1	

Brake Pipes (Continued)

ill.	Part Number	Price £ea.	Description	Req.	Details
6	GPP82AC	£15.85	PIPE, PDWA valve to rear brake hose	1	
7	GPP20AA	£9.90	PIPE, 3 way union to RH rear brake	1	
8	GPP32AA	£11.82	PIPE, 3 way union to LH rear brake	1	

PDWA Valve

There are two types of ‘Brake Pressure Differential Warning Actuator’ (PDWA) valves which may be found under the bonnet of your dual line-braked Midget 1500cc. They may be easily identified by the material that the main valve body is made from.

The one you are more likely to find is the cast iron item (AAU2583), which was the factory fitment during the period in which your car was built. On earlier USA market cars, plus other vehicles from the British Leyland line up, a brass PDWA valve (13H5905) was fitted, new brass valves have at times been more prevalent in the classic car spares market, with the result that many are now fitted to late model Midget 1500cc’s. As assemblies, the cast iron and brass valves are inter-changeable, however the actuator switches screwed into the bodies are not.

The switch to fit the brass valve, RTC826, has a coarse pitch thread of approximately 9mm diameter, whereas the switch for the cast iron valve, AAU1700A, has a fine pitch thread of approximately 15mm diameter.

10	AAU2583	NCA	VALVE ASSEMBLY, PDWA, (cast iron)	1		original, (cast iron)

73	BHA4706	£1.10	TUBE NUT, male	a/r	7/16" UNF thread

Brake Bleeding and Dual Circuit Brakes

The recommended replacement period for the originally specified brake fluid is 2 years.

Girling, the manufacturers of brake systems fitted on many motor cars, write:

“To enable brake fluid to work, it has to remain incompressible even at the high temperatures which can be generated within the brake system - up to 170°C. However, brake fluid is hygroscopic, which means that by its chemical nature it absorbs moisture (water) from the atmosphere through the reservoir breather & the flexible hoses. When the moisture builds up there is a major risk that, under heavy braking, the fluid will ‘boil’. The water in the system near the ‘hot spots’ (calipers & wheel cylinders) turns to vapour and then compresses. The technical term is vapour lock. The reality is at best a soft, spongy pedal, at worst total brake failure.”

They recommend that the boiling point of brake fluid should be tested periodically to indicate its moisture content. Such test equipment may not be readily available to the private owner. Thus the 2 yearly renewal procedure should be adopted.

The brake bleeding operation is clearly detailed in all quality service manuals for all types of car. What is missing from many publications is how to cope with dual circuit systems fitted with the pressure differential warning actuator (PDWA) valve. The trick with dual circuit systems incorporating the PDWA valve is to take matters slowly, bleeding one fully opened screw at a time, unless you can rely on assistants who would otherwise be required. Do not pump up pressure, nor push the pedal through its full stroke during the bleeding operation.

After bleeding the brakes completely, the brake warning light on the fascia is often illuminated. This will have been caused during the bleeding operation by a differential in fluid pressure in the system moving the valve shuttle, actuating the switch and blocking off one fluid circuit (exactly what it is supposed to do in the event of failure of one of the brake circuits). To re-centralise the shuttle the following steps should be taken:

1. Fit a rubber tube, as used in the bleeding operation, to a bleed screw at the opposite end of the car to that which has just been bled. Submerge the other end of the tube in a container of appropriate brake fluid.
2. Open the bleed screw.
3. Switch on the ignition but DO NOT START THE ENGINE (the brake warning light will glow).
4. Exert a steady but light pressure on the brake pedal until the brake light is extinguished. The moment the light goes out close the bleed screw and stop pressing the pedal (a click may be felt through the pedal as the shuttle returns to its mid-position).
5. Tighten all bleed screws.
6. When the system is sealed, depress the brake pedal and test for ‘feel’. The brake failure warning light should not glow if the brakes are correctly bled and the PDWA valve shuttle is set centrally.

Note: If the pedal is pushed too hard the shuttle will move to the other side of the valve, thus requiring the procedure to be repeated on a brake bleed screw at the opposite end of the car.

Clutch & Brake Fluids

When did you last change your Clutch/Brake fluid?

DOT3 fluid ought to be completely discarded, DOT4 (‘GBF4’) should be installed and replaced every 2 years, as recommended by manufacturers. An alternative, especially if you are replacing master cylinders, brake calipers and/or wheel cylinders, is to thoroughly flush out the pipes and install Silicone fluid (DOT5 ‘ABF’), which is ‘Non-Hygroscopic’, so it doesn’t promote rust problems in the hydraulic system. The bonus is that it won’t damage paint work.

When silicone is in use it will provide years of trouble free braking and an end to the monotonous and expensive pastime of repairing or replacing worn or leaking hydraulic components. Racing Fluid (DOT5.1 ‘GBF5’) really is the ultimate in brake fluid. Its anti-boil properties mean that even when the brakes get hot the fluid will remain efficient, rather than boiling locally (such as in the calipers) into useless vapour. Ideal on the race track or when the brakes are used to their limits. Due to its high ‘Hygroscopic’ nature, DOT5.1 Racing fluid should be replaced annually otherwise the quality and effectiveness will be drastically reduced.

Brake/Clutch Fluid (DOT4 Specification)

ill.	Part Number	Price £ea.	Description	Req.	Details
NI	GBF4102	£5.45	BRAKE/CLUTCH FLUID, DOT4	a/r	500ml
NI	GBF4103	£10.74	BRAKE/CLUTCH FLUID, DOT4	a/r	1 litre
NI	GBF4104	£42.00	BRAKE/CLUTCH FLUID, DOT4	a/r	5 litre

Silicone Brake/Clutch Fluid (DOT5 Specification)

NI	ABF3	£18.00	BRAKE/CLUTCH FLUID, DOT5	a/r	silicone, 500ml
NI	ABF4	£30.00	BRAKE/CLUTCH FLUID, DOT5	a/r	silicone, 1 litre

Racing Brake/Clutch Fluid (DOT5.1 Specification)

NI	GBF5102	£7.62	BRAKE/CLUTCH FLUID, DOT5.1	a/r	racing, 500ml
NI	GBF5103	£14.26	BRAKE/CLUTCH FLUID, DOT5.1	a/r	racing, 1 litre

Steering Column & Wheels

Steering Columns, Non-Collapsible

Ill.	Part Number	Price £ea.	Description	Req.	Details
1	17H9185	NCA	COLUMN, inner RHD/LHD, (no lock)	1	G-AN4, H-AN9
2	17H9184	NCA	COLUMN, outer RHD/LHD, (no lock)	1

6	AHA5435	£2.80	SEAL, draught excluding	1	

Steering Columns, Collapsible

Note: 1275cc Sprites & Midgets were freely available with RHD or LHD specification. While the Midget 1500cc (G-AN6) was manufactured in both RHD and LHD versions, the latter were exclusively North American market cars. This catalogue does not cover North American vehicles, if you require a steering column part (or any other component) for a LHD Midget 1500cc, please contact your local branch for details.

10	AHA9792	NCA	COLUMN ASSEMBLY, RHD, new	1	G-AN5-105501 On, To G-AN6-170989

Steering Column Cowls

35	18G8713	£21.00	COWLING, top & bottom halves, RHD	1	G-AN4, H-AN9 (without (headlamp flash on stalk)
	18G8388	NCA	COWLING, top & bottom halves, LHD	1	
36	18G8713	£21.00	COWLING, top & bottom halves, RHD	1	G-AN4, H-AN9 (with head- lamp flash on stalk) all G-AN5, G-AN6, H-AN10, A-AN10
	18G8714	£26.50	COWLING, top & bottom halves, LHD	1	
37	RMZ214	£0.35	SCREW, cowl	4	
	RMP214	£1.45	SCREW, cowl, chrome	4	

Steering Wheels

Note: Horn push pads are included here as they are seen to be part of the steering wheel. However, the full range of horn pushes and their associated components may be found in 'Switches & Controls (Fascia & Column)' on page 199.

40	AHA9193	£243.00	STEERING WHEEL, (wire spokes)	1	G-AN4, H-AN9
41	BHA4442	NCA	HORN PUSH, 'MG' logo	1	
42	BHA4441X	NCA	HORN PUSH, 'Austin' logo	1	
43	BHH111	NCA	STEERING WHEEL, (five hole spokes)*	1	To G-AN5-89514, To H-AN10-86302
44	31G1039	NCA	CENTRE PAD*	1	
45	BHA4979	NCA	BADGE, centre pad, 'MG' logo*	1	
46	BHA5010	NCA	BADGE, centre pad, 'Austin' logo*	1	

*Note: The steering wheel BHH111 introduced for the 1970 model year was the first on non-American Sprites & Midgets to be devoid of a horn push (the horn was operated from the indicator stalk). This state was not to last for long, however, because in July 1970 a new (but similar) steering wheel was introduced with a horn push pad in the centre. If you have an early 1970 car and you're stuck for a

BHH111 steering wheel, any of the later three wheels will do the job (BHH1307 is closest to original in style - it has five hole spokes), together with an appropriate horn push to act as a centre pad.

50	BHH1307	NCA	STEERING WHEEL, (five hole spokes)	1	G-AN5-89515 To G-AN5-123730, H-AN10-86303 On, A-AN10
51	BHH1307	NCA	STEERING WHEEL, (slotted spokes)	1	
				1	
52	BHH1307	NCA	STEERING WHEEL, (embossed spokes)	1	G-AN5-135882 On, G-AN6
53	BHA5053	NCA	HORN PUSH, no logo, (for Sprite)	1	
54	BHA5043	NCA	HORN PUSH, black, 'MG' logo	1	G-AN5-89515 To G-AN5-105500
	BHA5135	NCA	HORN PUSH, red, 'MG' logo	1	
	AAU1161X	£30.65	HORN PUSH, gold, 'MG' logo	1	used on selected 1975 G-AN6 cars
				1	

Note: The above horn push options are no longer available and can all be replaced by alternative horn push AAU1161. It is a direct fit to the original boss.

54	AAU1161	£30.65	HORN PUSH, black, 'MG' logo	1	use as replacement for NCA horn pushes
				1	
55	CHA748	£19.36	CENTRE PAD, hollow centre	1	G-AN6-200001 On
56	CHA747	£4.94	BADGE, black/silver, 'MG' logo, (original)	1	
	BHH1994	£3.13	BADGE, black, 'MG' logo, (alternative)	1	
	BHH2687	£5.34	BADGE, red/silver, 'MG' logo, (alternative)	1	
57	ACH6001	£5.00	NUT, steering wheel to column	1	
	BHH2103	£4.00	NUT, steering wheel to collapsible column	1	
58	6K900	£0.82	WASHER, shakeproof	1	

Removing and Refitting Components

1. The steering lock

There are several ways of removing steering lock shear bolts, which by security conscious design will have sheared their heads off during fitting. The methods range from the ham-fisted (ignoring the bolts and simply hack-sawing the lock off, thereby destroying it) to a couple of more rational ideas described below. If there is any of the shear bolt material proud of the steering lock casting, it may be possible to create a slot across it with careful use of a hacksaw and then undo the bolt with a screwdriver. If this is not possible, the bolt can be undone by putting the point of a centre punch near the outer edge of the sheared surface of the bolt, then angling the punch so that when struck by a hammer it knocks the bolt round in an anti-clockwise direction. Repeating this action will, of course, eventually undo the bolt. Granted, it's a slow procedure, but it works every time.

Drilling the bolts out is not really recommended if the lock is to be saved, unless you are remarkably skillful (or lucky) in your aim, the drill will probably drift into the soft metal of the lock casting, leaving rather too much of the relatively harder bolt complete. In the same vein, using an 'Easyout' (a device for removing broken studs) is a bit of a gamble, if the Easyout breaks, as it will if you get a little too enthusiastic with it, you will be left staring at something that's definitely too hard to drill out.

2. The steering wheel

When trying to ease the steering wheel off the tapered splines on the top of the column without the aid of the correct wheel pulling tool (i.e. jiggling it from side to side and tugging at the same time, or tapping the back of the wheel with a soft faced hammer), make sure that the wheel retaining nut is still held on the end of the column by a thread or two.

You'll have saved face - literally - when the wheel eventually breaks free in a hurry from its splines. Going back to the start of the task, scratch a mark on the top of the inner column to match another on the wheel centre, so that later during re-assembly you don't have to go through the hit and miss process of trying to get the wheel on straight again.

3. Joining the steering column to the steering rack

Never attempt to join the column and steering rack together without the rack clamps being loose enough to allow a little rotation of the rack in its mountings. The movement will allow the splines of the column and rack to settle properly in line with each other; only then should all the bolts be nipped up tight: the column pinch bolt first, followed by the rack mountings. If the rack pinion was not quite in line, so that the column exerted a lateral pressure on it, abnormal wear on bushes and bearings would result.

The Embarrassing Horn Fault

One sunny afternoon, you find yourself driving along in town with the hood down, generally enjoying life. You turn a corner slowly into a crowded street in your gleaming pride and joy and...the horn blares out, whereupon everyone stops and stares/glares at you. But you're sure you didn't touch the horn. Later, you drive over a bump while following a taxi and the horn goes off again. You hide miserably behind the steering wheel, as much out of sight of the taxi driver as possible. Once back at the sanctuary of your house, you wreak revenge on the horn controls, carrying out a thorough inspection and overhaul. A couple of days later, the same embarrassing events repeat themselves. You can't believe it.

Try this test: Hold the steering wheel and try to pull it back towards yourself, then push it forwards, away from yourself, as far as you can. You will probably be shocked at the amount of longitudinal play (though not as shocked as when the horn goes off again).

The excessive play - which at its worst point enables the horn circuit to be unintentionally completed - is due to worn thrust washers on the steering rack pinion. If you fancy your chances dealing with fine tolerance shims & things, have a go at repairing it. If you're sensible, exchange your steering rack for a new or reconditioned item.

'Early' Rack (1967-71)
(G-AN4; to G-AN5-114642; H-AN9; H-AN10; A-AN10)

'Late' Rack 1972-79
(G-AN5-114643 on; G-AN6)

Steering Racks

Two types of rack were fitted, the Morris Minor sourced item giving way to the later Triumph design (intermittently) from GAN5-114643. The racks are not interchangeable unless the mounting brackets, track rod ends and steering arms (on the stub axles) are also changed.

129	145108	£2.50	DAMPER PLUG, nylon	1	
			(This plug is in the rack tube, under the passenger's side rack mounting bracket).		

Oil or Grease?

Factory manuals offer the following information on which lubricant to use in each rack:

Early Rack (1967-71): At regular intervals, apply a gun filled with SAE 90 Hypoid oil to the lubrication nipple on the rack housing and give ten strokes.

Late Rack (1972-79): Remove the grease point plug and screw in place a grease nipple (part number 056935). Turn the steering wheel to full right hand lock, then apply a grease gun (filled with multi-purpose grease), to the nipple and give five strokes only (over greasing may damage the gaiters). Replace the nipple with the plug.

Finally, **NEVER** assume that a reconditioned rack has been pre-filled with lubricant.

Front Suspension

Shock Absorbers & Springs

ill.	Part Number	Price £ea.	Description	Req.	Details
1	GSA103	£120.00	SHOCK ABSORBER, LH, new	1	
	GSA103E	£27.60	SHOCK ABSORBER, LH reconditioned	1	exchange
	GSA102	£120.00	SHOCK ABSORBER, RH, new	1	
	GSA102E	£27.60	SHOCK ABSORBER, RH, reconditioned	1	exchange
2	53K1364	£2.40	BOLT, shock absorber to frame	6	
3	GHF333	£0.20	WASHER, locking	6	
4	GHF302	£0.46	WASHER, plain	6	
5	53K1389	£0.85	BOLT, fulcrum pin clamping	2	
6	GHF322	£0.14	WASHER, shakeproof	2	
7	2A4082	£1.60	BUFFER, shock absorber arm	2	
10	CHA129	£21.00	ROAD SPRING, front	2	G-AN4, G-AN5, To G-AN6-171477, H-AN9, H-AN10, A-AN10 From G-AN6-171478
	CHA570	£19.75	ROAD SPRING, front	2	
11	AHA6378	£4.30	BUMP STOP	2	
12	2A4031	£22.30	SPRING SEAT, lower	2	
14	53K1368	£0.40	BOLT, spring seat to lower wishbone	8	
15	GHF301	£0.13	WASHER, plain	8	
16	GHF222	£0.50	NUT, nyloc	8	
20	AHA7029	£135.00	LOWER WISHBONE ASSEMBLY*	2	new, BMH
	AHA7029Z	£68.50	LOWER WISHBONE ASSEMBLY*	2	new, (aftermarket)

*Note: Don't be perturbed if you own a pre-1974 car with 'handed' wishbones - i.e. the piercings & reinforcements for mounting the anti roll bar are only in one side of each wishbone. Only in 1974 was the anti roll bar made a standard feature (although there can't have been more than a handful of pre-1974 cars, 'Frogeye' Sprites and their ilk excepted, which didn't have one), up to this point the wishbones were indeed handed. Subsequently, wishbones became ambidextrous and that is the way they are still supplied today. If you still have a pair of handed wishbones in good condition, they're quite a curio & a desirable commodity to the Concours d'Elegance aficionados. With the front suspensions propensity to fail the MOT and require complete overhaul (the wishbones being one of the favourite sacrificial items) there can't be many left around now.

21	51K3424	£0.41	WELCH PLUG	2	
22	2A4020X	£8.30	FULCRUM PIN, king pin to wishbone	2	
23	8G589	£3.00	PLUG, screwed	2	
24	UHN400	£0.60	GREASE NIPPLE	2	
25	2A4272	£4.20	PIN & WASHER, inner wishbone pivot	4	
26	2A4024	£1.80	WASHER, special, bush retaining	4	
27	8G621Z	£1.30	BUSH, wishbone to chassis, rubber	8	
	8G621SPK8	£42.10	BUSH KIT, wishbone to chassis, poly (Kit includes: 8 bushes & 4 tubes).	1	
28	GHF223	£0.40	NUT, nyloc	4	
30	BTA745	NCA	STUB AXLE, LH	1	new
31	BTA745BE	£53.30	STUB AXLE, LH*	1	reconditioned, exchange
	BTA744	NCA	STUB AXLE, RH	1	new
	BTA744BE	£53.30	STUB AXLE, RH*	1	reconditioned, exchange

*Note: A reconditioned stub axle is supplied as a sub-assembly, complete with king pin kit (the king pin bushes are fitted and reamed to suit).

32 LN30041 £0.70 GREASE NIPPLE, stub axle, lower 2
33 UHN445 £1.33 GREASE NIPPLE, stub axle, upper 2
35 8G4220Z £26.20 KING PIN, each 2
QHOP624TCF £71.00 KING PIN KIT, car set 1 includes fulcrum pins
GSJ783 £40.00 KING PIN KIT, car set 1 no fulcrum pins
36 2A4206 £0.44 CORK SEAL, large 2
37 2A4205 £0.50 CORK SEAL, small 2
38 51K1769 £1.24 COTTER PIN 2
39 WL700101 £0.14 WASHER, locking 2
40 GHF206 £0.08 NUT 2
41 BTA613 £0.44 SEALING RING, lower 2
42 ATC4246 £3.40 KING PIN BUSH, lower 2
43 BTA382 £5.20 KING PIN BUSH, upper 2
44 BTA607 £0.29 SEALING RING, upper 2
45 2A4006 £2.54 THRUST WASHER 2
46 2A4007 £0.61 SHIM, 0.008"* a/r
47 ND607041 £1.24 NUT, slotted 2
48 GHF503 £0.20 SPLIT PIN 2
GHF224 £0.38 NUT, nyloc 2 alternative to items 47 & 48

*Note: Contrary to the usual outcome of adding shims to an assembly, these shims should be added to loosen the king pin and taken away to tighten it (a sufficient quantity of shims are supplied in king pin kits and reconditioned stub axles).
The procedure is to fit an 0.008" and a 0.012" shim over the thrust washer, fit the top trunnion and tighten down the top nut (if you intend to fit a nyloc nut upon assembly on the car, use your old nut now for this test fitting). Resistance should just be felt when the stub axle is turned on the king pin and there should be no obvious vertical play. If this isn't the case, add or subtract shims until you are satisfied. Too much play, on the one hand, and you'll fail the MOT. On the other hand, too much resistance and the self centring effect of the steering will be lost - at the least disconcerting, if not dangerous.

49	18G1006A	£163.00	REAMING TOOL, king pin bushes	1	
50	2A4005	£21.40	TOP TRUNNION	2	
	2A4028K	£5.90	TOP TRUNNION KIT (Includes items 51, 52, 53, 54).	2

Removing The Front Suspension

It is considerably easier to dismantle the old suspension unit (consisting of the wishbone, king pin and shock absorber) and assemble the new one on a workshop bench, rather than working within the confines of a cramped front wheel arch. Sprites & Midgets are among many car designs where this act of comparative working luxury may be carried out.

Removal of the suspension unit may be carried out thus:
Undo the brake caliper from the swivel axle, then tie it up under the wheel arch so that it doesn't hang from its hose. Supporting the wishbone securely with a trolley jack, undo the bolts holding the shock absorber to the car body. Pull the shock absorber out from under the wheel arch and let the jack down slowly, so that the wishbone pivots down to a near vertical position. Remove the road spring (no need for spring compressors here) and then undo the wishbone inner pivot bolts. Remove the suspension unit from the car. It's really that simple.

Refitting is the exact reverse of the above procedure.

Rear Suspension

Note: Please see the Accessories section for uprated suspension & conversion kits.

ill.	Part Number	Price £ea.	Description	Req.	Details

Hints for Suspension Assembly

It is suggested that you should always have a tin of copper grease or anti-seize compound around when carrying out the re-assembly of suspension components. A dab of grease on all threads (and inside any rubber bushes with steel inserts) will ensure ease of removal in the future.

Whilst on the subject of hardware, new nuts, bolts & washers should be used for re-assembly if possible, emphasis should be applied to renewing locking or shakeproof washers (spring or star washers). Nyloc nuts should never, ever be reused, especially in safety related areas like suspension.

Don't over tighten nuts or bolts holding rubber pivot bushes in place, correct torque settings are published in factory & aftermarket workshop manuals and should be adhered to.

If a bush is clamped down too tightly, it will not be able to insulate against shocks or provide the correct degree of pliability. Worse than this, it will effectively be half seized, and it won't take long to seize up completely. The result will be a broken pivot or undue wear on the components the bush is in contact with, possibly weeks or even only days later.

New lever arm shock absorbers (the type fitted as standard to all Sprites & Midgets) require priming before offering up to the car. This means holding the shock absorber at the angle it would normally be when on the car, working the arm from one extreme of its travel to the other until all of the 'dead spots' you feel in the arm's movement have disappeared.

You may appreciate that working several times from end stop to end stop is not normally encountered by the shock absorber when fitted to the car, as a consequence, it may take some time to fully prime itself if the task has not been carried out beforehand.

Rear Axle & Propshaft

Rear Axle & Axle Case

Collapsible & Non-Collapsible (Solid) Spacers

Pinion bearing pre-load was originally set by the use of a collapsible spacer between the two bearings. The correct pinion bearing pre-load is achieved when a rotational torque of between 11 & 13 pound inches (lbs. ins.) is required to rotate the pinion in the differential housing. This figure should only be checked when the seal is not fitted. It is attainable only when the pinion nut has been tightened sufficiently to 'nip' or pre-load the two bearings. It is not acceptable to over tighten the pinion nut and slack it off to obtain the correct bearing pre-load, if the spacer is over compressed then it must be scrapped, and a new one fitted.

The differential pinion may have had, at some time in its life, a solid spacer and shims fitted instead of the collapsible spacer; this is not uncommon. The solid spacer system was utilised on the similar differential fitted to Morris Minor cars up to around 1959, after that the collapsible spacer system was used. The collapsible spacer is a far quicker (& therefore cheaper) method of obtaining pinion bearing pre-load and was adopted by many motor manufacturers.

Installing the solid spacer and shim system is time consuming because the entire assembled pinion must be fitted, tested, stripped and reassembled to adjust the bearing pre-load by the addition or subtraction of shims. Once set in this way the pinion bearing pre-load is impossible to change.

Conversely, the collapsible spacer system can be adjusted after fitting if the pinion nut is removed and then refitted at a different torque setting. This means that service replacement of the differential pinion oil seal must be done with care, especially when refitting and re-torquing the pinion flange nut. A solid bearing spacer is offered for those who wish to convert to the more permanent solid spacer system. The solid spacer is part number BTA532X. Four different thickness adjusting shims are available as listed here.

140790	£2.10	SHIM, (0.030")	a/r
140791	£3.30	SHIM, (0.010")	a/r

Different(ial) Noises

A well respected former employee of MG at the Abingdon works always reminisces, when prompted to do so, about the period in 1973 when workers at the Dunlop tyre factory in Birmingham were indulging in a lengthy spell of industrial action. As a result, new Midget wheels with tyres, became increasingly scarce at Abingdon. Finally it got to the point where in order to keep the Midget production line running, wheels were rationed to four per car - in other words, enough to roll the cars off the end of the line, but without spare tyres. About the same time, a terrible warranty problem was experienced with Midget rear axles. Almost every new car, upon returning from the customary scenic test drive around Abingdon, was being sent to the rectification bay with the observation 'noisy diff'. Just a bad batch of differentials, perhaps? Axles from another production batch were tried on some of the cars, but to no avail. Axles were quickly stripped and inspected, each providing the same result: no fault found. History doesn't record the time it took to link 'lack of spare tyre' and 'noisy diff' together, but at some point the penny dropped. Without spare tyres fastened to them, the Midget boot floors were reverberating in a

manner that sounded just like a faulty differential. Just remember this when your differential has, all of a sudden, started to make the kind of noise that scares your cheque-book witless!

Starter Motors

Sprites and Midgets were all fitted with Lucas starter motors. Lucas developed the starter throughout the production life of the cars; the net result was two starter motors of clearly different construction which were, in fact, interchangeable. They may be identified by the following:

Lucas Type M35G (original MG part no. 13H559):

Stamped with Lucas no. 25079, plus suffix between A and H.

Lucas Type M35J (original MG part no. 13H5798):

Stamped with Lucas no. 25149.

The factory has now replaced the early design (which had radial brushes contacting a 'side' commutator) by an all-variants-encompassing starter motor of the later design (with axial brushes contacting a 'face' commutator).

Ill.	Part Number	Price £ea.	Description	Req.	Details
------	-------------	------------	-------------	------	---------

(Inertia Starter Motor)

1	GEU9405	£75.00	STARTER MOTOR, new	1	all models
---	---------	--------	--------------------	---	------------

(Hi Torque Starter Motor)

	GXE4405X	£205.00	STARTER MOTOR, new*	1	A Series
--	----------	---------	---------------------	---	----------

*Note: These brand new (non-exchange) powerful Pre-Engaged (Geared) starter motors are High Torque, meaning they will not suffer the same fate as the original 'Inertia' type, especially on high compression engines and, they are a direct replacement. No more costly motor rebuilds or excessive battery drain.

Lucas 25149 Starter Motor

Note: If you wish to repair your own starter motor, you must identify which type is fitted prior to ordering spares for it. The following is a parts breakdown by Lucas model type.

Stopping Trouble - before the Starter Stops

A starter motor often provides warnings in the form of jamming, slow cranking, or intermittent operation, before it fails completely. Obviously it is in the owner's interests to confront any problems before they become terminal. Having removed the starter from the car, it can be carefully dismantled on a work surface & the possible causes for impending failure investigated. Resist the temptation to submerge the unit in cleaning fluid, doing so would probably result in the purchase

Battery Lead/Terminal Positions

Terminal Layout No.1

Terminal Layout No.2

Stopping Trouble - before the Starter Stops (Continued)

of a new starter, since fluid will transfer copper dust from inside the motor to the electrical windings, causing a short circuit. Dust may be removed by compressed air and wiping with a rag dampened with cleaning fluid. The starter bendix gear can be cleaned and then inspected both for damage and spring return operation. If faulty, the sub assembly can be replaced. The shaft bushes pressed into the front and rear end plates of the motor should be renewed if necessary. These are 'Oilite' bushes, which should be immersed in light engine oil for 24 hours prior to fitting (the bush material absorbs the oil, to give prolonged lubrication). 'Old lags' of the starter reconditioning trade have jam jars filled with oil and bushes awaiting use. Excess oil must be wiped away upon installation of the bushes (which is achieved by pressing, not hammering!). Carbon brush replacement, if necessary, can be effected by soldering the replacements to the commutator end shield brush contacts - not hard, just fiddly. The copper wire windings and insulation of the armature and commutator assembly should be inspected (the commutator is the segmented copper collar contacted by the carbon brushes at one end of the armature). The contact surface must be clean, smooth and concentric to the armature axis. A dirty commutator can be cleaned by wiping with a petrol moistened cloth, then lightly polished with very fine glass paper. If the commutator is not true or excessively scored, it will need to be turned at high speed in a lathe and machined with a very sharp tool. Not everyone has such equipment to hand (!), but most people know of someone who has. The lightest of possible cuts should be made on the lathe to 'true up' the contact area. A very light polish after turning with very fine glass paper is recommended. Under no circumstances should the insulation material between the copper segments of the commutator be undercut. Re-assembly of the starter is the reverse of disassembly. The factory workshop manual may be consulted for any further information. Before refitting to the car, the motor must be tested. Secure the starter motor body carefully in a vice and test it by connecting it with heavy gauge cables (jump leads are ideal) to a 12 volt battery. Connect one cable to the starter terminal, the other should be held against the drive end bracket. The starter should run at high speed under these light load conditions. Upon rotation, the bendix gear should move axially along the armature shaft towards the motor itself. When the power is removed and the motor stops, the gear should return to its original position at the outer end of the shaft.

Battery & Battery Fittings

Important Notes for Battery Lead/Terminal Positions

Sprites and Midgets started life with a positive earth electrical system. This was changed to negative earth in November 1967 (at G-AN4-60460 and H-AN9-72041), resulting in the battery terminal polarities being switched (this was achieved by a battery with a different terminal layout). When the Midget 1500cc was introduced at G-AN6-154101, the battery terminal layout again had to be revised. The car retained a negative earth system but the terminals had to return to their original positions. This was because the 1500cc Triumph-sourced power unit had the starter motor fitted to the left side of the engine, as opposed to the BMC 'A' series unit with its starter on the right side. The body earth point for the battery is always on the left side of the bulkhead on the chrome bumper cars, and on the right side of the bulkhead on the rubber bumper cars. When the correct battery is fitted, the terminals should be nearer the bulkhead than the heater. Sketches of the two possible terminal layouts for batteries are shown above.

Standard Output Batteries (Original Layout)

Ill.	Part Number	Price £ea.	Description	Req.	Details
50	GBY5601D	£88.00	BATTERY, 12 volt, dry, (originally layout 1)	1	To G-AN4-60459,
	GBY5601W	£88.00	BATTERY, 12 volt, wet, (originally layout 1)	1	To H-AN9-72040,
			(+LHF/-RHF, 30 A/hr, positive earth).		
	GBY015	£88.00	BATTERY, 12 volt, wet, (originally layout 2)	1	G-AN4-60460 On,
			(36 A/hr, negative earth).		G-AN5, H-AN9-72041
					On, H-AN10, A-AN10,

GBY5601D	£88.00	BATTERY, 12 volt, dry, (originally layout 1)	1	
GBY5601W	£88.00	BATTERY, 12 volt, wet, (originally layout 1)	1	G-AN6
		(+LHF/-RHF, 30 A/hr, negative earth).		

Note: Due to delivery restrictions of hazardous goods, wet batteries can only be delivered by road and sea carrier to UK and mainland Europe. Dry batteries can be delivered worldwide, customers must arrange their own filling of dry batteries with suitable electrolyte and initial charge.

Alternator
(1275cc - 12V588, 12V778 engines; 1500cc - all FP Series Engines)

Dynamo & Alternator

Dynamo
(1275cc - 12CC, 12CE, 12V586 engines)

Original fitment dynamos are identified as follows:

ill.	Part Number	Price £ea.	Description	Req.	Details
	MG No. 13H826		Stamped with Lucas no. 22742		
	MG No. 13H219		Stamped with Lucas no. 22700		(plus suffix between A and M)
	MG No. 13H4813		Stamped with Lucas no. 22775		

Note: All of these are now replaced by one type of unit, this being:

1	GEU3101	£62.10	DYNAMO, new	1
---	---------	--------	-------------	---

Note: When installing a replacement dynamo, remember it must be polarised to suit the electrical system (Sprites and Midgets with dynamo charging systems can be either positive or negative earth, depending on year of manufacture). Polarisation may be effected as follows:
Fit the dynamo, without connecting it to the vehicle's electrical system. Connect one end of a length of wire to either the 'live' (i.e. not earth) terminal of the battery, or the battery lead terminal (not the starter lead) on the starter solenoid. Hold the other end of the wire against the 'Field' terminal (the smaller of the two) on the back of the dynamo for three to five seconds. Polarisation is now complete. Remove the temporary wire and connect the dynamo to the wiring harness.

Alternator

(1275cc - 12V588, 12V778 engines; 1500cc - all FP series engines)

From 1972 (1969 in Australia) an alternator was fitted. Originally there were two alternators, with different outputs, only a higher output unit (directly replacing the others) is now supplied. The pulley diameter was reduced in 1973 (from engine no. 12V588F3193) to increase the running speed. This improves charging at low engine speeds and is thus a good idea for earlier alternator fitted cars. A shorter fan belt (GCB10813 instead of GCB10838) is needed for the smaller pulley.

30	GXE8211	£55.00	ALTERNATOR, exchange, recon	1	17 ACR type
31	18G8620	£6.10	BEARING, rear	1

34	18G8619	£6.10	BEARING, front	1	
36	BAU4443A	£14.60	REGULATOR	1	2 or 3 lead type
	BAU5264	£16.00	REGULATOR	1	4 lead type
37	BAU5063	NCA	RECTIFIER	1	with 2 connections
	AEU4152A	NCA	RECTIFIER	1	with 3 connections
38	607693A	NCA	BRUSH BOX	1	
39	AEU3079A	NCA	PROTECTION DEVICE, anti-surge	1	If fitted
40	GEU250	£4.50	PLUG KIT, for wiring harness	1	
41	C37222A	£17.12	FAN, cooling	1	12V588, 12V788 units
	AAU3956A	£10.44	FAN, cooling	1	all 1500cc units
42	12G1054	£13.00	PULLEY, alternator driving, 2.75" dia.	1	to 12V588F3192
	BAU1461A	£14.05	PULLEY, alternator driving, 2.5" dia.	1	12V588F3193 on, 12V778
	AEU1238	£11.40	PULLEY, alternator driving	1	all 1500cc units
43	37H2258	NCA	SUNDRY PARTS KIT	1	(inc. pulley nut and washer)

Note: Owners of earlier Australian cars with 15 AC alternators may have to find local specialists to rebuild them. However, if you just need a brush set or regulator.

GGB503	£2.30	CARBON BRUSH SET	1	15AC alternator only
BHA4789	£45.30	REGULATOR, type 4TR, (4 terminals)	1	
GEU6609	£37.50	REGULATOR, type 4TR, (3 terminals)	1	

The other solution to deal with more severely damaged units is to fit the later 17ACR alternator, together with the plug kit (items 30 and 40, above). A small amount of conversion work is required, so it might be advisable to entrust the process to your local auto-electrician.

Dynamo/Alternator Mountings

1275cc - 12CC, 12CE and 12V Series Engine Nos.

50	12A526	£17.80	BRACKET, rear mounting	1	dynamo fitment
	12G1053	£8.50	BRACKET, rear mounting*	1	alternator fitment
51	SH605061	£0.14	SCREW, bracket to engine block	2	dynamo fitment
	SH605071	£0.46	SCREW, bracket to engine block	2	alternator fitment
52	GHF332	£0.20	WASHER, locking	2	
53	GHF104	£0.50	BOLT, dynamo/alternator to bracket	1

85	JN2158	£0.35	NUT, locking*	1	
86	BH605181	£0.85	BOLT, (link to thermostat housing)	1	
87	GHF332	£0.20	WASHER, locking	1	

*Note: Factory alternators are now supplied with metric versions of these items.

Charging Faults on Dynamo Fitted Cars

All too often the dynamo and the voltage control box are both replaced, when only one needed to be, to cure a charging fault. It is not impossible to test the dynamo on the car to ascertain whether it or the control box is unserviceable, thus potentially saving the cost of one replacement unit. This may be done using the following procedure:

1. Check the fan belt for correct tension and battery condition.
2. Wiring continuity and connections between the dynamo and regulator must be checked: The brown/yellow wire with the larger 'Lucar' (spade) connector runs between the large dynamo terminal and the control box 'D' terminal. The brown/green wire with the smaller 'Lucar' connector runs to the 'F' terminal on the control box. Renew any connectors or wires found to be faulty. The next stages require a 'moving coil' voltmeter with full a scale reading of 0-20 volts.
3. Turn off all auxiliary switches: for example lights, heater, radio etc. Disconnect from the dynamo and insulate both 'Lucar' connector fitted wires (to prevent a possible short circuit).
4. Connect a length of wire between the two terminals on the dynamo.
5. Start the engine and run at normal idling speed. Connect the voltmeter between a good earth on the dynamo mounting yoke and one of the dynamo terminals. Take care to observe the correct polarity of the voltmeter with respect to the car or it may be damaged.
6. Carefully and gradually increase the engine speed. Do not race the engine in an attempt to increase the voltage indication. See that the voltmeter reading does not reach 20 volts, it should rise without fluctuation, with the engine speed. If this is so, the dynamo is probably not faulty. If there is no reading, check the dynamo brush gear and wiring connections. If the reading is low (approximately 1/2 to 1 volt), the dynamo field windings may be faulty. If the reading is approximately 4 to 5 volts, the dynamo armature windings may be faulty.
7. Stop The engine.
8. If the dynamo is found to be in good order, leave the temporary link wire connected to the dynamo. Disconnect the 'F' & 'D' terminal wires at the control box. Reconnect the two 'Lucar' terminals to the dynamo. Connect one probe of the voltmeter to the wire that was connected to the 'D' terminal of the control box, the other to a good bodywork earth. Repeat step 6.
9. Attach the probes of the voltmeter between the earth (as before) and the end of the wire which was connected to the control box 'F' terminal. Repeat step 6 once more. If the results of steps 8 & 9 are not the same as step 6, suspect faulty wiring between the dynamo and the control box.
10. Stop the engine. Remove the temporary wire connection from the dynamo terminals. Reinstall the wiring correctly to the dynamo and the voltage control box.

If no faults were found, the problem is likely to be the control box.

52	GHF421	£0.12	SCREW, (switch to 'A' post)	2	A-AN10

Reversing Light Switches

54	13H4216Z	£19.70	SWITCH, reversing lamps	1	G-AN4-58112 On, G-AN5, H-AN9-70268 On, H-AN10, A-AN10
55	PCR409	£0.85	'P' CLIP, (cable securing)	1	
56	GAE191A	£7.00	SWITCH, reversing lamp	1	G-AN6
57	GHF302	£0.46	WASHER, switch seating	1	
58	ULC1178	NCA	CLIP, cables to gearbox	2	
59	503213	NCA	INSULATING SLEEVE, (for clip)	2	

Fitting Reversing Lights

Cars built after the chassis numbers above were fitted with reversing lamps, which automatically operated when reverse gear was engaged. A plunger switch, in a threaded hole in the gearbox remote housing, sensed when the gear selector mechanism was in the reverse gear position.

Owners wishing to fit reversing lights to cars not originally so fitted would be wise to check whether the gearbox remote housing in their car has the necessary tapped hole to accept the switch. If it has, the only major task is to site the reversing lamp(s).

Those without the correct housing will either have to try to obtain one, or fit a manual switch and a warning lamp in the cockpit of the car (the warning lamp is a legal requirement in the UK for manually operated reversing lights). Wiring provisions will have to be made to connect the switch, power source and lamps. Before fitting reversing lamps (or any auxiliary lamp), local regulations should be consulted regarding positioning, quantities, power, warning lamp requirements, etc.

Headlamp Dip Switch

60	RTC432A	£11.30	SWITCH, (headlamp dipping)	1	G-AN4, H-AN9
61	RTC432CAP	NCA	RUBBER CAP, (for non-slip operation)	1	
62	SE910201	£0.50	SCREW, switch to bracket	2	
63	WL700101	£0.14	WASHER, locking	2	
64	AHA5516	NCA	BRACKET, dip switch mounting	1	
65	SE604041	£0.25	SCREW, bracket to toe board, LHD	2	
	SE604081	£0.40	SCREW, bracket to toe board, RHD	2	
66	GHF331	£0.12	WASHER, locking	2	

Voltage Control Boxes

(Dynamo fitted cars only)

Two distinctly different designs of voltage control box were used on dynamo-fitted MG Midgets and Austin Healey Sprites. The chassis number of your vehicle will indicate which type should be fitted (as detailed above). If in doubt, count how many screws fix the unit to the car, study the method used to retain the cover over the electrical mechanism, or read the manufacturer's information and terminal coding stamped on the unit. The earlier unit is the Lucas model RB106. It may be identified by its two screw attachment to the bulkhead, the spring wire clip securing the cover and its terminals, which are marked 'A1', 'A' 'F', 'D' and 'E'. The later type is the Lucas model RB340. It is attached to the car with three screws, the cover is retained by two push-in snap headed fasteners and it bears the terminal identifications 'E', 'D', 'WL', 'F' and 'B'. The two types of voltage control unit are not easily interchangeable. It is not correct to say that either unit will always bear the Lucas name and/or the model type number. This is due to reproductions from non original equipment manufacturers servicing the demands of the marketplace. The quality of such units should not be dismissed, because these alternative manufacturers often supply product to Lucas.

Within the pages of the factory-produced workshop manual, details may be found for test and adjustment procedures relevant to each of the two types of control box. Such adjustments are to rectify problems that may have occurred during service. If components within the voltage control box are found to be damaged, it will probably be easier to replace the entire unit. However, simply cleaning the electrical contacts often cures a charging fault.

75	GEU6603	£21.30	VOLTAGE REGULATOR BOX	1	G-AN4, H-AN9
76	PMZ320	£0.46	SCREW, (regulator attaching)	2	
77	WL700101	£0.14	WASHER, locking	2	G-AN5, H-AN10, A-AN10
79	GEU6605	£30.50	VOLTAGE REGULATOR BOX	1	
80	PMZ318	£0.50	SCREW, (regulator attaching)	3	
81	WL700101	£0.14	WASHER, locking	3	

Radio Equipment

85	MRA001	£8.50	AERIAL, manual, (retractable)	1	radio to aerial cable
NI	AJM1112X	£49.60	AERIAL, electric, (retractable)	1	
86	ZKC533	£12.00	EXTENSION LEAD	a/r	fits original radio console
87	DZB5645	NCA	LOUDSPEAKER, oval	1	

Note: Cars fitted with radios may experience interference from other electrical equipment on the car. To lessen interference, which is heard as a crackle or buzz, suppressors may be fitted to the possible sources. If in doubt consult your radio equipment supplier.

88	DZB5567	NCA	SUPPRESSOR, (radio interference)	a/r	coil or fuel pump fitment
	579356A	NCA	SUPPRESSOR, (radio interference)	a/r	alternator fitment

Distributors

Lucas distributors were used exclusively on Sprite & Midget models throughout production. They can be identified by both type and specification number (both may be found stamped on the casing). These numbers are listed below to assist in identifying the unit you have fitted to your car. Note that a similar model type distributor found on another type of car will seemingly fit and run in your car. However, it may have a detrimental effect on your car's overall performance as the ignition advance/retard characteristics are unlikely to be matched to your engine's requirements.

Distributors 1275cc
(12CC, 12CE and 12V engine nos.)

ill.	Part Number	Price £ea.	Description	Req.	Details
1	12G815	£122.11	DISTRIBUTOR, new (Without vac' advance: Lucas 23D4, no 40819).	1	To 12CC/Da/H11638
2	12G2055	£101.14	DISTRIBUTOR, new (With vac' advance: Lucas 25D4, no 41270).	1	12CC/Da/H11639 On, 12CE, 12V
3	GDC102	£10.20	CAP, distributor	1	for screw-fitting leads
	GDC103	£5.80	CAP, distributor	1	for push fit leads
4	262703A	£4.32	BRUSH & SPRING, high tension	1	
5	GCS2101	£3.00	CONTACT SET, ('points')	1	standard fitment
	GCS111	£12.00	CONTACT SET, ('points')	1	fast road/competition
6	GSC111	£2.20	CONDENSER	1	
7	GRA2101	£2.80	ROTOR ARM	1	
	GRA2101HQ	£7.50	ROTOR ARM, high quality	1	
8	37H2981	£8.40	LOW TENSION LEAD & INSULATOR BLOCK	1	
9	GCS1001S	£0.66	SCREW, (for points)	1	
10	GSC1001S	£0.50	SCREW, (for condenser)	1	
11	TT1903	£10.20	SPRING SET, auto advance	1	selective fitment kit
12	511851	NCA	FELT PAD, (cam spindle lubrication)	1	
14	27H7645	£61.30	VACUUM ADVANCE UNIT* (Replacement - with push fit pipe union).	1	12CC/Da/H11639 On, 12CE, 12V

*Note: Originally the advance unit had a threaded union to a metal vacuum pipe. Later this was changed to a push fit union to a plastic pipe, it is the latter which is available as a service part today. If you replace the advance unit on a metal pipe fitted car, also replace the metal pipe with the plastic version and its relevant connectors - or squeeze a rubber connector over the end of the metal pipe to adapt it.

20	513682A	£0.71	'O' RING, sealing distributor to block	1	
21	606895	£22.00	BUSH, distributor spindle	1	cut to correct length
22	8G726	£17.30	COVER, waterproof	1	
23	12G335	NCA	SUPPRESSION SCREEN, distributor	1	French markets
24	12G337	NCA	COVER, suppression screen	1	(if fitted)
25	V242	£1.10	WING NUT, cover securing	2	
26	3H2138	£12.30	PLATE, (clamping distributor to block)	1	
27	SH604041	£0.20	SCREW, clamp plate to block	2	
28	GHF331	£0.12	WASHER, locking	2

96	12B2095	£1.00	CONNECTOR, straight, rubber	a/r	with 'push fit union'
97	12B2062	£1.10	CONNECTOR, right angled, rubber	a/r	advance unit,
					FP series (1500cc)
98	138892	NCA	CLIP, plastic pipe to fuel line	3	FP series (1500cc)

Ignition

Timing Terms & Details

The dwell angle is the angle passed through (in degrees) during which the distributor points remain closed for each ignition cycle. The total number of degrees in each cycle is 360° divided by the number of cylinders (i.e. 90° in the case of a four cylinder engine). The correct dwell angle setting for each of the two Sprite & Midget engines dealt with in this catalogue is as follows:

Engine Capacity	Distributor Model	Dwell Angle
1275cc	Lucas 23D4 OR 25D4	60° +/- 3°
1500cc	Lucas 45D4	55° +/- 5°

The dwell angle can be checked with a suitable meter at all engine speeds. If the needle of the meter vibrates during the test, then there is an appreciable amount of wear between the distributor shaft and its bearing. If the dwell angle is too low, the points gap is too wide (and vice versa).

'Ignition timing' is the angle, in degrees, when the ignition spark occurs relative to the engine crankshaft's rotation. The position used as a datum is top dead centre (TDC) of the firing stroke for each cylinder. If an engine requires timing to 4° (degrees) BTDC (Before Top Dead Centre), the spark should occur when the rotating crankshaft reaches this angle Before Top Dead Centre.

If the ignition timing is said to be 'advanced', the spark is occurring before the specified point in the cycle. Retarded ignition, of course, means the opposite. The high pitched engine knock known as 'pinking' is usually associated with an ignition that is too advanced. Retarded ignition manifests itself by overheating and loss of engine power (a 'popping' sound may also be heard in the exhaust note when the engine is over-running, for instance running down hill without use of the accelerator). These sounds are of course not sure-fire diagnoses, as the fuel used and general engine condition are also contributory factors. Heavy carbon deposits in the combustion head will induce pinking in an engine with perfect ignition timing, under certain conditions and loads.

All standard distributors on Sprites & Midgets have a centrifugal advance mechanism. The faster the engine (and thus distributor) rotates, the further the timing advances to improve performance and economy. The centrifugal system is critical to the correct operation of the engine.

A vacuum advance system was also fitted to all 1500cc engine cars and post-1967 1275cc models. Similar in function to the centrifugal system, it uses vacuum from the induction system to apply the advance. Poor cruising speed economy can result from a failed vacuum advance unit.

Spark plugs should always be checked for the correct electrode gap before installation. As a rule plugs are supplied with the correct gap: between 0.024" and 0.026" (0.610 to 0.660 mm). If one new plug in a set of four has far too tight a gap, it may have been dropped at some point. A faulty new spark plug is frustrating to diagnose. It is best to buy well known brands of plugs (beware of auto-jumble '95% off retail price' sold-from-a-bucket plugs - you get what you pay for).

Early 1275cc Wiper Motor System

Later 1275cc and all 1500cc Wiper Motor Systems

Wiper Motor System

Two different wiper systems were fitted; the early square body motor was replaced by the round type when the change from positive to negative earth was made. The change also involved complete replacement of all wiper parts (they are not interchangeable).

Early 1275cc models with Lucas DR3A type
'Square Body' Wiper Motor (To G-AN4-60459; to H-AN9-72040)

ill.	Part Number	Price £ea.	Description	Req.	Details

125	GWV829	£2.00	JET, plastic, single	2	

Headlamps & Front Side/Indicator Lamps

Note: Please see the Accessories section for Halogen headlamp conversions & high output bulbs.

Headlamps

The headlamps fitted to Sprite & Midget cars break down very simply into four types. These are left hand dipping for RHD cars & right hand dipping for LHD cars, each with, or without an integral side lamp (pilot lamp). French markets required a cadmium yellow headlamp bulb to be fitted whereas the rest of the world called for a clear bulb. Many local regulations exist where lamps are concerned; if in any doubt consult your local authority about their requirements. Remember that it is possible that what was originally specified for your car when it was constructed may not be valid today. Only the RHD version is shown for Midget 1500cc's, since apart from North American specification, there were no LHD cars. If, however, you require LHD headlamps for a Midget 1500cc (say, for mainland European) the 'Germany only' headlamp intended for earlier models will suffice. This headlamp is not allowed for use in North American markets.

ill.	Part Number	Price £ea.	Description	Req.	Details
1	27H8499	NCA	HEADLAMP, sealed beam (RHD, no pilot lamp).	2	G-AN4, G-AN5, H-AN9, H-AN10, A-AN10
	AEU1061A	£52.50	HEADLAMP, P45T asymmetric (LHD, no pilot lamp, not Germany).	2	
	BAU1177A	£50.40	HEADLAMP, P45T asymmetric (LHD, with pilot lamp; Germany only).	2	
	13H7922	NCA	HEADLAMP, sealed beam (RHD, with pilot lamp).	2	G-AN6
2	GLU101	NCA	SEALED BEAM UNIT (RHD, no pilot window).	2	60/45 watt
	13H3471A	£15.25	SEALED BEAM UNIT (RHD, with pilot window).	2	60/45 watt
3	27H4146A	£21.30	LIGHT UNIT, P45T asymmetric (LHD, no pilot hole).	2	
	27H5981A	£21.70	LIGHT UNIT, P45T asymmetric (LHD, with pilot hole).	2	
4	GLB410	£2.75	BULB, P45T, clear glass, (tungsten)	2	45/50 watt
	GLB411	NCA	BULB, P45T, cadmium yellow, (tungsten)	2	
	GLB2983	£8.65	BULB, P45T, clear glass, (quartz halogen)	2	60/55 watt
6	BAU2110	£6.30	ADAPTOR, Lucar type, (with cable)	2	no provision for pilot
7	BAU2111	£10.00	ADAPTOR, Lucar type, (with cable)	2	for sealed beam with pilot
8	27H5976	£14.26	ADAPTOR, Lucar type, (with cable)	2	for P45T with pilot
10	GLB501	£0.60	BULB, pilot, capless type	2	fits BAU2111 only
11	GLB233	£0.62	BULB, pilot, bayonet fitment type	2	fits 27H5976 only

24	21G9057	£0.19	WASHER, rubber, screw retaining	2	
25	37H7421A	£1.55	CLIP, rim screw securing	2	
26	57H5455	£12.50	RIM, headlamp, (spring clip fitting)	2	G-AN6
27	BAU1460	£1.80	SPRING CLIP, rim securing	2	

Headlamp Fitment Hardware

The headlamp units were attached to the front wings by more than one method. The most common method used was screws and nuts, this was replaced at a late date by the use of either self tapping screws or pop rivets. The latter was preferred by the production line for speed of assembly (this was in keeping with construction methods utilised by contemporary car manufacturers).

30	PMZ314	£0.20	SCREW	8	'screw & nut' method
31	GHF306	£0.20	WASHER, plain	16	
32	WL700101	£0.14	WASHER, locking	8	
33	GHF206	£0.08	NUT	8	
34	AB610051	£0.20	SCREW, self tapping	8	'self tapping screw'
35	WE702101	£0.20	WASHER, shakeproof	8	method
36	569313	£0.46	RIVET, pop type	8	'pop rivet' method

Upgrading Your Headlamps

The simple replacement of standard Sprite/Midget headlamps with a pair of halogen units will bring your car's light output up to today's standards. Halogen headlamps offer significant improvements to lens design, ensuring all the light output is directed into the correct area to guide you. A range of replacement halogen headlamps suitable for Sprites & Midgets are detailed in the Accessories section.

It may be noticed that ordinary halogen bulbs do not have a much greater power rating than the older designs of headlamp. Yes, there are radically more powerful bulbs available in the marketplace, but you need to check legislation before using them on a public highway; also be aware that the wiring & switches in the car were designed many years ago to cope with lamp power ratings used at that time.

Front Side & Indicator Lamp Assemblies 1275cc (G-AN4; G-AN5; H-AN9; H-AN10; A-AN10)

40	13H428	£31.00	SIDE & INDICATOR LAMP, LH	1

Front Fog & Spot Lamps (Period Style)

Best suited to G-AN4 and H-AN9 models, these fog and spot lamps were offered as optional extras for several years to proud owners of new Sprites and Midgets. Due to mounting and aesthetic difficulties it is not advisable to attempt fitment to the later rubber bumper fitted cars! The common denominators in the rules of maintenance on headlamps or driving lamps of any type are that the lenses are kept clean and that the beams of light are correctly aligned & directed to give maximum benefit without dazzling other road users. These are admittedly obvious points of advice, but they can make a significant difference to lighting efficiency. Spending good money on uprated and additional lamps will provide little or no improvement if the advice is not followed.

110	MM162-800	£75.00	FOG LAMP, base mounted	a/r	
111	ACG5179	£33.00	LENS & REFLECTOR	a/r	
112	GLB323	£5.15	BULB, transverse filament	a/r	
113	MM162-700	£75.00	SPOT LAMP, base mounted	a/r

Reversing Lamps

1275cc

(G-AN4-58112 on; G-AN5; H-AN9-70268 on; H-AN10; A-AN10) 1500cc Models (G-AN6)

40	AAU5510	£12.60	REVERSING LAMP	2	
41	37H7512	£6.20	LENS, reverse lamp	2	
	37H7512Z	£4.20	LENS, reverse lamp	2	aftermarket
42	37H1759	£0.55	GASKET, lens & lamp mounting	4	
43	GLB273	£0.82	BULB, festoon type, 21 Watt	2	
44	PMP214	£0.40	SCREW, (lens attaching)*	4	G-AN4, G-AN5, to G-AN6-190000 approx. H-AN9, H-AN10, A-AN10

*Note: The lamps were originally attached to the body by the screws which hold the lens in place, driving into caged nuts on the inside of the rear panel. If these caged nuts are missing or damaged, the later 1500cc Midget fasteners can be used to attach the lamps).

45	AB606082	£0.30	SCREW, lens and lamp mounting	4	
46	PFS316	NCA	SPIRE NUT, retaining	4	G-AN6-190000 on approx.
47	AHH7449	NCA	PROTECTOR, screw tip	4	
48	HMP240009	NCA	FILTER, orange*	2	French markets only

*Note: The French market required the reversing lamps to show amber light, instead of white. This was achieved by inserting an amber filter between the bulb and the lens.

Number Plate Lamps

Early 1275cc

(G-AN4; H-AN9)

50	127916	£21.60	NUMBER PLATE LAMP, chrome	1/2

	AHA9458BKT	£30.00	BRACKET, RH	1	

Early 1500cc

(To G-AN6-169643)

80	127916	£21.60	NUMBER PLATE LAMP, chrome	2	
	127916Z	£13.00	NUMBER PLATE LAMP, plastic	2	
81	502264	£9.76	COVER, chrome	2	
82	17H5385	£1.80	SCREW, (cover/lens to back plate)	2	
83	601721A	£4.42	LENS, clear glass	2	
84	57H5368	£3.22	GASKET, (lamp to number plate)	2	
85	GLB989	£0.71	BULB*	a/r	

*Note: A single bulb was used originally in this lamp. However, all lamps offered more recently are of a slightly modified design & contain two bulbs.

86	AJD8012Z	£0.20	NUT, (lamp to number plate)	4	
87	WL700101	£0.14	WASHER, locking	4	
88	GHF306	£0.20	WASHER, plain	4	
89	27H6713	£0.71	CONNECTOR	4	electrical bullet terminal

Late 1500cc

(G-AN6-169644 on)

95	127916BLK	£22.00	NUMBER PLATE LAMP, black*	2	
----	-----------	--------	---------------------------	---	--

96	502264	£9.76	COVER, black	2	
97	601721A	£4.42	LENS, clear glass	2	
98	57H5368	£3.22	GASKET, (lamp to number plate)	2	
99	GLB989	£0.71	BULB	4	
100	7H5123	NCA	SUNDRIES KIT	2	
101	AJD8012Z	£0.20	NUT, lamp to number plate	4	
102	WL700101	£0.14	WASHER, locking	4	
103	GHF306	£0.20	WASHER, plain	4	
104	27H6713	£0.71	CONNECTOR, (bullet terminal)	4	

*Note: Original black number plate lamps were as described above. Spurious replacement lamps of similar appearance have also worked their way onto cars over the years. Be warned - replacement lamps may not be repaired by the above components. The simple identification test is the cover material: Metal almost certainly means original, plastic means replacement.

70	ULC1178	NCA	HARNESS TAG, bolted to gearbox	1	G-AN6
71	503213	NCA	INSULATING SLEEVE, (on loom tag)	a/r	
72	AAU5034A	£8.50	DIODE, brake warning circuit	1/2	From G-AN6-212001

Fitting a Wiring Harness

1. Obtain your new harness before removing the old one. This is not really stating the obvious. A number of owners in the past have enthusiastically disembowelled the electrical systems of their cars, only to discover that there was no 'off the shelf' replacement part currently available.
2. Get a copy of the wiring diagram specific to the year & build condition of your car. These are usually reproduced in the factory service manual or handbook.
3. Remove the battery from the car before starting harness replacement. This ensures that you will not be tempted to have a trial run before the job is completed.
4. If the fasteners securing the old harness to the body are not to be replaced, they should be carefully removed and their positions noted. Make a sketch of the less memorable routing details of the harness; under-bonnet, boot and floor photographs would also be most helpful.
5. When disconnecting the old harness from switches & instruments, it would be advisable to cut the old wiring from each item so that an 'inch or so' is still attached to it. By so doing, the quandary of matching a clump of wires to the terminals on a switch may be easily resolved; simply remove the old stump of wire from the terminal and replace with the corresponding coloured wire from the new harness.

Too easy!

Instruments & Cables

Note: Please see the Accessories section for further information.

Important Note: Please read this before ordering instruments.

The easiest instrument identifier is the 'Smiths number' on the face of the gauge (shown in brackets on this page). The part numbers listed here are for new instruments. Reconditioned exchange instruments are also available and may be ordered by adding an 'E' suffix to the part number of the corresponding new instrument (exchange instrument part numbers are not shown here because of space constraints - they are, however, all in the price list). When purchasing a reconditioned exchange unit, please note that your old unit must be returned to us (fully assembled and in a condition judged by the vendor to be repairable) at the time of purchase. Otherwise a surcharge will be levied, to be refunded at the time when the old unit is returned.

Speedometers and Tachometers

ill.	Part Number	Price £ea.	Description	Req.	Details
1	BHA4436E	£73.20	SPEEDO', 'MPH', (SN6142/00)	1	To G-AN4-66225, To H-AN9-77590

108	AJH5182	£10.70	BEZEL, 2", fuel & temp. gauges	a/r	

*Note: Quantities are two of each for an internally lit water/oil gauge, one of each for an externally lit water/oil gauge and one of each for either an internally or externally lit fuel gauge.

'Toggle' Switch Fascia - Early 1275cc
(G-AN4; to G-AN5-105500; H-AN9; H-AN10; A-AN10)

Fascia & Steering Column Switches

The most obvious change in switches occurred at the start of the 1972 model year (i.e. the introduction of the 'round wheel arch' 1275cc model) when the traditional toggle switches gave way to the safer rocker type. Rocker switches were then used up to the end of Midget 1500cc production.

'Toggle' Switch Fascias

(G-AN4; to G-AN5-105500; H-AN9; H-AN10; A-AN10)

ill.	Part Number	Price £ea.	Description	Req.	Details
1	BCA4294	£11.60	SWITCH, side/headlamps	1	toggle type
2	149011A	£13.96	SWITCH, panel lights	1	
3	149011A	£13.96	SWITCH, windscreen wipers	1	

Additional toggle switches of either type can be used to operate electrical accessories that may be installed. A toggle switch is held in place by a threaded chrome ring, which may be tightened using a tubular tool with two protruding drive lugs which locate in corresponding slots in the ring. A simple replica of this tool can be made from a 4" length of metal tube with an internal diameter greater than 9/16" and less than 5/8" (19/32" is ideal). The external diameter should be greater than 3/4". With the tube held vertically in a vice, one end of the tube can be filed to produce two diametrically opposed lugs which are both long enough - and wide enough, to fit the slots in the face of the chrome ring. For the sake of a few minute's work, you will have created the right tool for the job - infinitely preferable to employing screwdrivers and pliers, which would almost inevitably result in some form of damage to the chrome ring, the switch itself or the paint finish on the fascia!

4	NCA	SWITCH, heater	1	see pages 200 to 205
---	-----	----------------	---	----------------------

Ignition Switches & Steering Locks

Steering locks became a standard feature in December 1970 (at G-AN5-96272/H-AN10-86765). Prior to this date they were an option in selected markets only.

5	13H337	NCA	SWITCH, ignition & starter	1	G-AN4, To G-AN5-89514 H-AN9, To H-AN10-86302
	13H337Z	£10.30	SWITCH, ignition & starter, aftermarket	1	
6	24G1345	£8.00	LOCK BARREL, with two keys	1	

	127651	£12.60	SWITCH, ign/starter/acc. (less barrel)	1	G-AN5-89515 To 96272,
	24G1345	£8.00	LOCK BARREL, with two keys	1	H-AN10- 86303 To 86765
7	BMK2259X	£144.00	STEERING LOCK*	1	G-AN4, To G-AN5-96272,
8	27H6237	NCA	SWITCH, ignition & starter	1	H-AN9, To H-AN10-86765
9	27H9394	NCA	SHEAR BOLT	1	(optional fitment)
10	BMK2259X	£144.00	STEERING LOCK*	1	G-AN5-96273 To 105500,

Information for Warning Lights & Instrument Bulbs

The power rating of the bulbs used to illuminate warning lights and instruments should not be increased from the original specification: the extra heat from an uprated bulb may distort plastic components nearby. Please see 'Harnesses & Fittings' on pages 194 & 195 for suitable bulbs.

Heater System Early 1275cc
(G-AN4; to G-AN5-91407; H-AN9; to H-AN10-86377)

no heater fitted)

Heater Systems

Heaters - An Overview

There were three clearly different layout designs for heating in Sprites and Midgets; in addition to this was a fresh air system (see page 202) that was offered to certain overseas markets as an option (it was in fact no more than an empty heater box with an air control valve). The first heater layout (the unit itself is described on page 203) utilised the 'square box' heater and separate fan & was fitted from 1967 up to half way through 1970. The 1967 built cars were unique in having the air control valve in the front panel of the car, as opposed to being sited on the blower assembly. The 1275cc cars built between 1970 & 1974 had a longer heater casing with an integral fan; to accommodate the heater in the revised engine bay of the Midget 1500cc, a mirror image of this system was used. The heater units for these last two systems are on page 205. The heater outlets within the passenger compartment and the ducting which led to them, remained the same on all Sprites & Midgets and is described later on this page.

Heater System Early 1275cc

90	101343	£5.69	ADAPTOR, (pipe to water pump housing)	1	

Heater Outlets/Hot Air Ducts

(All models)

A light coating of flexible sealant should be applied to the flap door frame where it contacts the area around the heater outlet on the footwell side. This will reduce or eliminate annoying air leaks and draughts in the footwell. A typical sealant would be 'instant gasket'.

95	13H59SS	£23.30	FLAP, heater outlet on footwell side	2	stainless steel
96	GHF421	£0.12	SCREW, door to footwell side	8	
97	14G3499	£6.40	ELBOW, heater outlet to hose	2	
98	BMK924A	£1.55	CLIP, securing tube in elbow	2	
99	AHH8394		NCA HOSE, elbow to nozzle	2

116	CFP625	£0.56	PLUG, heater cable hole in bulkhead	1	
117	AHH5514	£0.60	PLUG, heater cable hole in fascia	1	

Heater not Hot?

This complaint (unusual on Sprites & Midgets, which normally roast their occupants!) can be attributed to many different faults. These range from the heater water valve on the engine not being open (easy to cure ...), to an air lock in the heater matrix (can prove to be quite stubborn).

1. Check the engine achieves running temperature, as indicated by the temperature gauge. If not, inspect the thermostat for operation at the correct temperature. Replace as required. It is not uncommon to fit a 'hotter' thermostat for cold conditions (see pages 134 & 137 for details).
2. Check water flow through the matrix of the heater. This may be done by removing the return hose from the heater to observe water flow from the matrix. If little or no water flow is apparent, the problem may be that the water tap on the cylinder head (1275cc cars) or the top of the footwell (1500cc cars) is blocked. The other alternative is that the heater matrix itself is choked or suffering from an air lock. Back-flushing will clear blockages, forcing water through the system, for example with the aid of a garden hose, will purge the matrix of air locks. Note: If the system contains water which is at all warm, release the cooling system pressure cap carefully prior to disconnecting the hoses.
3. Check operation of the air flow flap valve and mechanism. Corrosion or electrical arcing may have damaged or seized the control cable (See the notes on pages 203 and 205 for reference to the rubber insulation sleeve required on the cable).
4. Check air flow into and through the heater box. Clear any obstructions. (See the note on page 205 regarding the foam seal required around the matrix).
5. Check the function of the blower fan and also direction of motor rotation. (See the note on page 203 regarding the wiring of heater blower motors). Problems with the motor & fan usually manifest themselves by the heater system displaying a complete inability to demist the windscreen without outside help (winding down windows to aid air flow - not pleasant on a dark, frosty morning). Due to the convoluted passage of heated air to the demister ducts, it is critical that the fan and motor are in first class order. Otherwise, although the air may leave the heater piping hot, it fails to reach the windscreen in a useful manner - if it gets there at all. This is by far the most common complaint about the heating system.

Heater & Fresh Air System Early 1275cc

Fresh Air Unit- Early 1275cc
(Special order - export markets)

This curiosity was available for fitment to hot climate export model cars. It consisted of no more than an early type square heater box (with an air valve mounted on the side) with nothing inside it! The principle was to pipe in cool(ish) air from outside the vehicle and to be able to control and direct that air flow within the passenger compartment in the same way as was possible with a normal heater unit. Air was fed into the system via a four inch diameter hose from the front panel next to the radiator; this at least guaranteed that occupants did not suffer an influx of hot fumes from the under bonnet area. However, in a non-heater fitted car in the more temperate climates of Britain and most of mainland Europe, one would probably prefer to have blanking plates over the heater apertures in the bodyshell (rather than suffer uncomfortable icy draughts from a fresh air system during all but the couple of weeks of genuinely hot weather in the course of the year). This preference was born out by production specifications for the markets concerned.

Blower Assembly Early 1275cc

Essentially there were two types of blower used (which shared most of their components). The 1967 variant lacking the air valve fitted to the later type: see the comment in the overview on the previous page. The many types of original motor/fan combination are now rationalised to a newer type, supplied as an assembly rather than as a separate motor, fan and fastening. The heater motor is a voltage polarity sensitive item, this means that if it is wired up the wrong way round, it will rotate in the opposite direction. This of course means that if you convert your car from positive to negative earth, you must confirm the polarity of the heater motor and its direction of rotation. To change the direction of rotation of the motor is simple: just swap over the two plug-in terminals on the motor. Try it to see if your heater blower is really living up to its name. If instead it has been sucking all these years, you will just have found the reason you always condemned the heater as a useless piece of junk that would really be best used as a wheel chock!

89	GHF206	£0.08	NUT	3	

Control Cables Early 1275cc

The air valve control cables are of different lengths to suit the position of the air valve in the engine bay. The blower motor switch is incorporated in the control cable assembly, except of course in the case of the fresh air unit control cable (the fresh air system did not use a blower). The air valve control cable must be carefully secured on its route from the bulkhead. If left free to move, it will invariably end up shorting out electrical terminals, for example the brake light switch or the HT leads - or worse still, the battery! The cable should be treated in much the same way as the capillary for the temperature gauge, in other words securely clipped and with no tortuous routing! Fitting a rubber insulation sleeve on the outside of the cable is further insurance, protecting the cable from its environs.

Control Cables
Late 1275cc & 1500cc

This diagram illustrates the components of the air hoses for the Late 1275cc and 1500cc engines. It shows two hoses, labeled 100 and 101, which are connected to the engine via a bracket (103). The bracket is secured with a bolt (104), a nut (105), a washer (106), and a lock washer (107). The hoses are shown in a curved position, indicating their flexibility.

Heater & Fresh Air System Late 1275cc & 1500cc

Heater Unit - Late 1275cc

(G-AN5-91408 on; H-AN10-86378 on; A-AN10)

ill.	Part Number	Price £ea.	Description	Req.	Details
1	AHA9727	£306.80	HEATER UNIT & BLOWER	1

Heater Unit 1500cc

(G-AN6)

When the 1500cc Midget was introduced at G-AN6-154101, the heater box & fan assembly was again redesigned. This was because the fresh air intake tube would otherwise have been too close to the exhaust manifold and fuel induction system of the Triumph engine. This, the last development of Sprite & Midget heaters, looks like a mirror image of the previous late 1275cc item (and it is - almost).

Leaking Heater Valves

Around October and again in April, there occurs a very healthy upward blip in sales of heater water valves (taps). This perennial phenomena can be attributed to the seal within the valve sticking and being torn asunder when the valve is opened for the winter duration (having been left closed all Summer) or vice versa.

By way of interest, when this happens on an MGB, not only is the cooling system affected, but the ignition system also breaks down - the errant valve drips water onto the distributor below it!

Fortunately this is not the case with Sprites & Midgets.

Good quality antifreeze solution in the cooling system should put pay to any corrosion occurring internally, similarly a small drop of oil on the exposed mechanism of the water valve during the year should ensure that the rotating cam, lever & spindle do not seize up, nor corrode.

This should ensure that the water valve lasts more than a season.

Insulating The Heater Control Cable

The heater control cable is routed through the bulkhead and past the battery on its way to the air valve and thus should have a length of protective rubber insulating sleeve around it (the choke control cable also should wear a similar sleeve). Today, more often than not, this item is missing. The sleeve insulates the metal outer casing of the cable, to stop it from 'shorting' out on the battery or other electrical terminals in the proximity of its route. It also prevents the cable from chattering on the heater box, or the underside of the bonnet (and removing paint from either).

Wrap Up Your Matrix!

The principle of the heaters operation is to pass air through the water heated matrix (also known as the heater radiator, or heat exchanger), to raise the temperature of the air, the warmed air can then be distributed into the car via various outlet ducts. The front & rear faces of the matrix are covered by a foam seal within the heater box. After a period of time this foam seal degrades and disintegrates, allowing passage of air around the matrix rather than down through it (the incoming air will take the route of least resistance, around rather than through the matrix). This means, of course, that the air is barely warmed as it passes through the heater system.

Fitment of the foam seal is easy... but only once the screws that secure the heater box to the bulkhead have been removed. Having first undone the water hoses, you will find that the whole assembly is attached to the bulkhead by either threaded machine screws (earlier 'square box' heaters with external blowers) or self tapping screws (later integral blower units). The latter are easy to deal with, whereas the former are invariably seized - whichever you have, don't forget to use a dab of anti-seize compound when you replace them. The heater box is held together by spring clips that can be easily prised away, allowing the front and rear cover plates to be removed, followed by the matrix. Before the new seal is installed around it, you should back-flush the matrix with a low pressure water supply (garden hose). 'back-flushing' means flushing the water through the matrix in the opposite direction to normal flow, to dislodge matter which may be blocking some of the waterways. Remember that the upper connection is the outlet (seemingly illogical, but true), so apply the water flow to this connection. The air fins of the matrix can be similarly cleared by (gently!) using a vacuum cleaner to remove any airborne debris that may be lodged within. This attention to detail doesn't take much more time, but will pay dividends in the efficiency of the heater.

Blower Motor Polarity

The heater motor is a voltage polarity sensitive item; this means that if it is wired up the wrong way round, it will rotate in the opposite direction. This of course means that if you convert your car from positive to negative earth, you must confirm the polarity of the heater motor and its direction of rotation. To change the direction of rotation of the motor is simple: just swap over the two plug-in terminals on the motor. Try it to see if your heater blower is really living up to its name. If instead it has been sucking all these years, you will just have found the reason you always condemned the heater as a useless piece of junk that would really be best used as a wheel chock!

Dash/Fascia Panels

When looking in the ‘remarks’ column for identifying features for your fascia, remember that over the course of time your fascia may well have been modified by an enthusiastic previous owner (or even yourself!) to accept extra gauges, accessory switches or (most commonly) to re-site the interior lamp to a position where it illuminated somewhat more of the cockpit than merely the gear lever gaiter and your knee.

ill.	Part Number	Price £ea.	Description	Req.	Details
1	AHA7436E	£92.20	FASCIA PANEL, RHD, (recon, exch.)	1	G-AN4, H-AN9 (round ‘toggle’ switch holes, hole above oil/ water gauge for blocked oil filter warning light)

	CHA660E	£84.00	FASCIA PANEL, RHD, (recon, exch.)	1	
	CHA732E	£78.90	FASCIA PANEL, RHD, (recon, exch.)	1	

The pressed steel fascia panel of the Midget & Sprite cars is finished in an attractive black crackle effect paint, as were other MG sports cars of the same era. As time passes, the paint scratches and the panel rusts causing the surface finish to peel and flake. A fully repainted and refurbished fascia panel can be obtained in exchange for your old one, or you could tackle renovation yourself.

Available through many specialist car spares stockist’s are aerosol cans of black crackle effect paint. The results from using these re-finishing paints are dependant on the temperature of the panel (absolutely crucial to obtain a uniform crackle effect - look for temperature guidance in the instructions on the can), the consistency of the spray coating and the condition of the panel surface to be painted. An excellent finish is achievable if the directions for use are followed.

Before embarking on a fascia panel re-spray, the whole panel should be removed from the car. This will ensure that you can strip away all the old paint, treat any corrosion found, weld up unwanted holes (made for accessories in years gone by) and finally apply a full coat of paint. Attempting to mask the instruments and switches instead of removing them is time consuming, ineffective and gives a completely unprofessional finish.

All painted finishes are only as good as the surface they are applied to. This is also true for black crackle effect paint. A smooth clean surface will help to ensure an even finish and the same crackled texture across the entire fascia.

Defer re-fitting of the panel for a few days after painting to allow the paint to thoroughly harden. The use of a proper tool to fit the switch retaining nuts (where relevant) will lessen the chance of scratching the new paint.

When refitting the instruments, note that some electrically operated units (e.g. fuel gauge) need to be earthed to work. The earth contact must be made on the back of the fascia. A thick coat of paint on an area that is not seen is not acceptable if you are expecting it to act as an electrical contact.

65	WK608214	£0.18	WASHER, cup	5	

Radio Mounting Panel

Originally, the radio mounting panel was a feature of North American specification cars which found its way on to other models if a radio was fitted (sometimes). It was trimmed in vinyl, which conveniently covered the extra holes for switches, warning lights etc. unless they were needed. In 1978 (from G-AN6-212001) the panel was made a standard feature on non-American vehicles, factory option radios becoming quite common by that date. At the same time, the cigar lighter (also by now a standard feature) and the ‘new’ handbrake warning light were positioned on the panel.

Note that an alternative Glass Reinforced Plastic (GRP) replica radio panel is also listed here.

Carpet Sets & Fittings

Interior Trim Kits/Panels & Fittings

Carpet Sets

We stock two formats of carpet set; a full 17 piece set and a footwell set. The full set contains all carpet components for the cockpit. The footwell carpet set contains 2 footwell mats and 2 crossmember carpets, allowing retrim of the worst worn areas.

Sprite IV & Midget III: 1967-74
G-AN4-5 & H-AN9-10 & A-AN10

Carpet Fittings

2	610624	£0.29	STUD, durable dot*	18
3	GHF400	£0.12	SCREW, stud to body*	18
4	2H8445	£0.30	SOCKET, carpet fastening*	18
5	14G8736	£0.20	SPIKE RING, socket to carpet*	18

*Note: These fastenings were used in the following applications: Five for each footwell carpet (one in each corner plus one in the centre, forward of the heel mat), two for the rearward lower edges of the gearbox cover, three each on the front and back edges of the rear shelf carpet.

Interior Trim Kits

Interior trim kits are accurately produced replacements for the original trim panels in your car. Each kit contains five footwell panels, door panels, (material to recover the recess in 1967-69 doors), sill liners, rear quarter panels and rear panel. The kits also include sufficient material to recover the door cappings, fascia crash rail, 'B' posts and to fit behind the joints between the three inner footwell liners. Door panels are also available separately in pairs.

1967-69
G-AN4 & H-AN9

This style of trim kit features door boards with 'recessed' centre panel trimmed separately and screwed to door shell. Available in original colour options as below.

10	645-670	£277.40	TRIM KIT, black/white piping	1	To G-AN4-66225
11	DP222AW	£123.36	DOOR PANELS, black/white piping, (pair)	1

1970-On
G-AN5 & G-AN6. H-AN9 & H-AN10

In 1970 a new style of trim was introduced, this style was continued to the end of production in 1979 in the various colour options detailed below.

645-700	£201.30	TRIM KIT, black	1	To G-AN5-105500
TBA0035L/R	£97.88	DOOR PANELS, black, (pair)	1	G-AN5-138801 On
				G-AN6; H-AN10; A-AN10
645-720	£201.30	TRIM KIT, autumn leaf	1	To G-AN5-123730
DP224K	£80.30	DOOR PANELS, autumn leaf, (pair)	1	G-AN5-138801 To G-AN6-200000; H-AN10; A-AN10
645-710	£201.30	TRIM KIT, navy blue	1	G-AN5-105501 To
DP224N	£70.10	DOOR PANELS, navy, (pair)	1	138800
645-722	NCA	TRIM KIT, ochre	1	G-AN5-123731 To
DP224T	NCA	DOOR PANELS, ochre, (pair)	1	138800
645-723	£201.30	TRIM KIT, beige	1	G-AN6-200001 On
DP224X	NCA	DOOR PANELS, beige, (pair)	1	

Trim Fittings & Hardware

12	HMP815012	£16.00	TRIM FITTING KIT	1
----	-----------	--------	------------------	---

13	GHF1232	£0.34	CLIP, trim	26	(18 on door trim panels, 6 on rear quarter trim panels, 2 on rear cockpit trim panel).
14	AB606033	£0.35	SCREW, inner door trim to door	4	
15	AD606044	£0.20	SCREW, footwell liners to body	22	
			(8 on inner footwell liners, 6 on outer footwell liners, 8 on sill liners).		
16	FWP906	£0.20	WASHER, cup	22	
17	GHF600	£0.10	RIVET, rear cockpit liner to body	8	
18	FWP906	£0.20	WASHER, cup	8	

Door Pulls

Door pulls in colours matched to the trim were introduced for the 1972 model year (G-AN5-105501 onwards, plus all G-AN6 models). For details of door pulls on earlier models, see page 221.

19	BFP1469PA	£10.00	DOOR PULL, black	2
	RGK6476	NCA	DOOR PULL, autumn leaf	2
	RGN6476	NCA	DOOR PULL, navy	2
	RGT6476	£9.83	DOOR PULL, ochre	2
	RGX6476AK	NCA	DOOR PULL, beige	2
20	GHF428	£0.14	SCREW, door pull to door shell	4
21	GHF1029	£0.60	NUT, locknut, (clip into door shell)	4

Door Check Straps

Door check straps were always produced in colours matching the interior trim. Their retainers and support brackets were always black on the 1967-69 cars. Thereafter retainers and brackets matched the trim colour except for navy interiors, which used navy retainers, but black brackets.

22	X3A3220	£11.00	DOOR CHECK STRAP, black	2
	X3R3220	£11.00	DOOR CHECK STRAP, red	2
	X3K3220	£11.00	DOOR CHECK STRAP, autumn leaf	2
	X3L3220	NCA	DOOR CHECK STRAP, blue	2
	X3N3220	£11.00	DOOR CHECK STRAP, navy blue	2
	X3T3220	NCA	DOOR CHECK STRAP, ochre	2
	X3X3220	£11.00	DOOR CHECK STRAP, beige	2
	240-673	£18.00	DOOR CHECK STRAP, honey tan	2
23	14A764	£1.70	RETAINER, check strap, black	2
24	14A6745	£2.00	BRACKET, support, black	2
25	RMZ316	£1.60	SCREW, check strap to 'A' post	4

Door Seals

A coloured, woven material facing was used on draught excluders fitted to 1967-69 cars. The facing for 1970 onwards models was made from a coloured textured plastic. The correct length for each draught excluder is 60". At the 'B' post (door latch) end, the last half inch of the rubber seal must be cut off to allow fitment of the chrome end cap over the facing only. If this measure is not carried out, the door will not close properly.

30	DEA3220	£13.50	DOOR SEAL, woven, black	2
	DER3220	£12.50	DOOR SEAL, woven, red	2
	KGA817	£7.00	DOOR SEAL, plastic, black	2
	KGK817	NCA	DOOR SEAL, plastic, autumn leaf	2
	KGN817M	NCA	DOOR SEAL, plastic, navy	2
	KGT817	£62.40	DOOR SEAL, plastic, ochre	2
	KGX817	NCA	DOOR SEAL, plastic, beige	2
31	613766	£0.52	CLIP	20
32	AHB9656	£1.50	FINISHER, draught excluder, front	2
33	AHA8162	£7.00	FINISHER, draught excluder, rear, RH	1
	AHA8163	£7.00	FINISHER, draught excluder, rear, LH	1
34	AB606033	£0.35	SCREW, finisher to 'B' post	4

Cockpit Edge Mouldings

40 & 41 - Material is included in the full trim kit to recover these mouldings.

42	AHA9167	£11.30	MOULDING, rear cockpit edge, black	1
----	---------	--------	------------------------------------	---

Note: originally models up to G-AN4-66225 and H-AN9-77590 were fitted with a grey moulding. This is now no longer available, we can only supply black.

43	AHA8141	£8.20	FINISHER, cockpit edge moulding, LH	1
	AHA8140	£8.20	FINISHER, cockpit edge moulding, RH	1

Note: originally models up to G-AN4-66225 and H-AN9-77590 were fitted with a grey moulding. This is now no longer available, we can only supply black. For fixing hardware, see 'Hood Fasteners (Fitted to Body)' on page 234.

Ashtray

45	AHA9728	NCA	ASHTRAY	1	G-AN5, G-AN6, 2 H-AN10, A-AN10

Front Seats

1967-68
(To G-AN4-66225; to H-AN9-77590)

The seat design for these cars was of a non-reclining type (a small amount of rake adjustment could be achieved by turning the relevant screw), the main distinguishing feature being the 'H' pattern of the white piping on the face of the seat back. The colour choices corresponding to the interior trim apply: Black with white piping, or Red with White piping.

ill.	Part Number	Price £ea.	Description	Req.	Details
1	640-910	£240.80	SEAT COVER KIT, black/white piping, vinyl	1

12	BHA4339	£0.48	CLIP, cover to frame	a/r	

1969
(G-AN4-66226 on; H-AN9-77591 on)

For 1969 a unique style of trim was used. Black with black piping was the only colour scheme available, an option of red with red piping was cancelled just before production started (information and part numbers for the red components still exist in factory internal publications). The material was arranged on the seat facings in narrow horizontal pleats. The number of pleats stitched into the facings varied during production, so don't worry if there is a one or two pleat difference between your old seat covers and the new ones, both are correct for a 1969 car! Midgets & German Sprites were given reclining seats, all other Sprites received non-recliners. To further complicate matters, North American 1969 cars had unique twin pole head restraints as well (not that they are relevant in this non-American spec. catalogue). None of these items, or the components thereof, were ever fitted to any other year of Sprite or Midget.

15	640-945	£240.80	SEAT COVER KIT, black/black piping, vinyl	1

1970-On
(G-AN5; G-AN6; H-AN10; A-AN10)

In 1970, alongside the developments in interior trim, the seats were given a new 'heat welded' pattern in a choice of two colours, black or autumn leaf. Black was dropped in favour of navy for 1972, ochre replaced autumn leaf in 1973. For 1974, black and autumn leaf were reintroduced, navy and ochre (which therefore only ran for one year) being dropped. Colours were not changed again until 1978, when beige replaced autumn leaf. For colour reference, please see the inside back cover. After the confusion caused by so many seat types being fitted in 1969 (four including the American market variants), the commercially sound decision was made to only offer reclining seats from 1970 onwards. With the introduction of the 1970 seat came the option of head restraints for the first time outside America, in the shape of a rather bulky 'D' section item also to be found on many other British Leyland cars of that period. Towards the end of the 1977 model year, a new oval section head restraint was substituted; this style remained with the car until the end of production.

45	640-960	£231.60	SEAT COVER KIT, vinyl, black	1

Chassis & Front Inner Panels

Front Chassis Frame

It is not advisable to attempt to fit a front chassis frame or sub-components thereof without the aid of a special jig to ensure dimensional accuracy of the front suspension and steering geometry. In other words, leave safety critical repairs such as this to the experts.

ill.	Part Number	Price £ea.	Description	Req.	Details
1	28G118	£546.00	FRONT CHASSIS FRAME	1	G-AN4, G-AN5, H-AN9, H-AN10, A-AN10
2	BMH8007	£31.90	MOUNTING RAIL, steering rack	1	
3	AHA5630	£58.80	CHASSIS RAIL, front, LH	1	
	AHA5628	£58.80	CHASSIS RAIL, front, RH	1	G-AN6
	CZJ676	£445.00	FRONT CHASSIS FRAME	1	
	BMH8031	£50.50	CHASSIS RAIL, front, LH	1	
	BMH8030	£50.50	CHASSIS RAIL, front, RH	1	G-AN4, G-AN5, H-AN9, H-AN10, A-AN10
4	MS40L	£37.50	FRONT CHASSIS LEG, LH	1	
	MS40R	£37.50	FRONT CHASSIS LEG, RH	1	
6	2A5463	£21.00	PIVOT BRACKET, front suspension (LH front bracket, RH rear bracket).	2	G-AN4, G-AN5, H-AN9, H-AN10, A-AN10
	2A5462	£21.00	PIVOT BRACKET, front suspension (RH front bracket, LH rear bracket).	2	
	CZJ543	£29.50	PIVOT BRACKET, front suspension (LH front bracket, RH rear bracket).	2	
	CZJ542	£29.50	PIVOT BRACKET, front suspension (RH front bracket, LH rear bracket).	2	G-AN6

Note: These pivot brackets carry the front suspension inner wishbone pivot pins and bushes. Remember when reinstalling the front suspension that the bushes should be lubricated with grease, both on the outside surface and inside where the pins contact them. Also, do not over tighten the nuts on the pins. Neglecting either of these pieces of advice may lead to a seized pin and bushes, the result of which will be abnormal wear on the pivot bracket. This is indicated by elongation of the holes in the bracket through which the pin passes (and a heavy knock from the front suspension as the pin rattles from one side of the hole to the other). Given these symptoms, the only safe cure is bracket replacement.

7	AHA5626	£9.00	BRACKET, LH	1	radiator & front end mounting

Splash Shields
(Not G-AN6 Models)

If you have a penchant for noticing such things, you will know from earlier in this catalogue that the design of steering rack fitted changed at the same time as the splash shields itemised below. This is not coincidental, part of the reason for having splash shields was to protect the steering rack gaiters from flying road debris. The earlier shields are deeper to correspond to the lower mounted early type steering rack, while logically the later (shallow) splash shields match the higher position of the later rack.

20	2A5592	£8.00	BRACKET, LH	1	radiator & splash shield
21	2A5591	£8.00	BRACKET, RH	1	
22	GHF117	£0.20	SCREW, (radiator/radiator cowl mounting)	4	
23	GHF331	£0.12	WASHER, locking	4	
24	PWZ204	NCA	WASHER, plain	4	
25	SH604051	£0.20	SCREW, (bracket to wheel arch)	4	

26	GHF331	£0.12	WASHER, locking	4	use if neither heater or fresh air unit are fitted
27	PWZ204	NCA	WASHER, plain	4	
28	CHA225	£60.00	SPLASH SHIELD, LH	1	
29	CHA224	£60.00	SPLASH SHIELD, RH	1	
30	AHA6223	NCA	PLATE, blanking	1	
31	PMZ306	£0.35	SCREW, plate to shield	2

33	GHF206	£0.08	NUT	2	

Bulkhead & Footwells

35	AHA8285	£195.00	FOOTWELL, LH	1	includes footwell outer side panels
	AHA8284	£195.00	FOOTWELL, RH	1	
36	CZJ171	£82.90	FOOTWELL TOP & FRONT, LH	1	G-AN4, G-AN5, H-AN9, H-AN10, A-AN10
	CZJ170	£82.90	FOOTWELL TOP & FRONT, RH	1	
37	2A5551	£11.00	INNER TOE BOARD, LH	1	G-AN6
	2A5550	£11.00	INNER TOE BOARD, RH	1	
38	AHA5622	£25.70	OUTER SIDE PANEL, LH	1	G-AN4, G-AN5, H-AN9, H-AN10, A-AN10
	AHA5620	£25.70	OUTER SIDE PANEL, RH	1	

Note: Having removed a badly rusted outer sill from a Sprite or Midget, the above mentioned outer side panel is often found to be in a similar condition (along with the lower parts of the 'A' post and front wing). In fact where the sill contacts the footwell outer side is usually the starting point for sill corrosion. You may notice, having removed the front wing, that the outer sill forms a wide step here, neatly boxed in at each side by the footwell side and wing, and to the rear by the 'A' post. Over the years, a large amount of 'silt' builds up in here, and the resultant dampness retention causes corrosion to get a foothold in all of the local panel seams and joints.

With the front wing in place, you cannot get a hand into this area to clean it out. Periodically running a hose pipe in through the engine bay and down the hole between the footwell and the wing to try to flush the dirt out through the narrow gaps between the wing, sill and 'A' post is probably as much maintenance as is reasonably possible. If you have just renewed the sills, the use of a wax sealant (such as Waxoyl) in the area will at least give them a fighting chance.

39	BMH8019	£46.20	BATTERY & HEATER SHELF UNIT*	1	G-AN4, To approx. G-AN5-91407, H-AN9, To approx. H-AN10-86377
40	HMP315001	NCA	BATTERY & HEATER SHELF*	1	
41	HMP415046	NCA	BRACKET, starter solenoid mounting	1	

*Note: These shelves are supplied without the starter solenoid bracket used on all Sprites & Midgets up to November 1967 (positive earth equipped cars). This bracket will, of course, require careful removal from the old scrap shelf before fitment of the new shelf to a positive earth car, as the bracket is not available as new from BMH.

	BMH8010	£46.20	BATTERY & HEATER SHELF UNIT	1	From approx. G-AN5-91407, G-AN6, From approx. H-AN10-86377, A-AN10
	CZJ174	£21.00	BATTERY & HEATER SHELF	1

British Motor Heritage Certificate of Authenticity
When you purchase a BMH bodysell from Moss Europe, you will receive a Certificate of Authenticity from British Motor Heritage. Confirming: BMH manufacture, date of purchase, body style and number.

Body panels - Introduction

Due in part to the well known and highly successful reintroduction of bodyshell assemblies by British Motor Heritage, a vast range of panel work is now available once more for Sprites & Midgets. The majority of the products laid out over the next few pages are British Motor Heritage produced panels, to Original Equipment (OE) specification. In theory, because of the bodyshell manufacture, any panel should be available. Please enquire about items you cannot find listed here which you feel that you need - it may be possible to supply them as a special order.

Bodyshells

Bodyshells service both RHD and LHD vehicles, except for Midget 1500cc shells, which are RHD only. All bodyshells are seam sealed, finished with electrostatic preparation, primer, anti-stone chip preparation (to the relevant areas) & bitumen sound deadening pads.

They are created using nearly 100% original factory tooling and assembly jigs and represent far and away the most economical and accurate method of rejuvenating a car with a badly corroded body. While a small amount of rationalisation of component panels from the different models has taken place (for the sake of cost effectiveness), none of this rationalisation affects either the overall appearance or reassembly procedure of the car - with small exceptions such as filling in the reversing light apertures and changing the door lock mechanisms for a particularly early G-AN4 or H-AN9 model. Sprite and Midget bodyshells may be ordered in two different states of build.

A complete bodyshell includes bonnet, front wings, front end assembly, doors and boot lid. The build will not include peripheral bolt-on sheet metal such as blanking plates, radiator cowl and splash shields.

ill.	Part Number	Price £ea.	Description	Req.	Details

42		NCA	'A' POST		see page 213
43		NCA	DOOR		see page 221

Outer Sills

Note: Inner sills are listed on page 224. Other components which are likely to be required during sill replacement are floor pan repairs (also on page 224), the filler pieces and rear wing front quarter repairs listed below, 'A' posts (or 'A' post repair panels) and footwell outer side panels which are also detailed on page 224. This sounds to be quite a shopping list, but you should consider that to fit a sill correctly (i.e. to gain access to some of the areas which must be welded) the front wing has to be removed together with the front lower corner of the rear wing. Be prepared to have to deal with extra, inevitable, corrosion damage which will only come to light when you have taken the wings out of the way.

45	AHA5553	£55.40	OUTER SILL, LH, (original)	1	G-AN4, G-AN5,
	AHA5552	£55.40	OUTER SILL, RH, (original)	1	To G-AN6-157671,

75		BOOT LID		see page 226

Windscreen, Glass & Fittings

For 1970 the windscreen frame was finished (unsuccessfully) in a black epoxy coating instead of the usual satin silver finish. Black was dropped just under 3000 cars later and satin silver windscreen frames were then fitted right up to the end of the model's production. Given that only a handful of those 3000 cars still exist, it would seem most unlikely that the black components will ever be remade for them (and that's the only place in this catalogue where you will find acknowledgement that the product will never be available again!).

The centre rod, its brackets and the type of mirror it supports all changed in 1970. Other than that, the only major windscreen assembly changes were for different market places: LHD cars had laminated glass rather than toughened, North American models also having sun visors (although this catalogue does not cover North American cars, sun visor components have been included for the benefit of customers who may wish to fit them). It seems unbelievable that at one time or another, ten different windscreens were used. This has been rationalised to four satin silver finished assemblies or frame kits, which will service all of the cars covered in this catalogue.

Please note that where a windscreen pillar or top rail is described as being 'for sun visor fitment' it means that it is drilled appropriately to enable the brackets to be attached.

Windscreen & Fitting Components

ill.	Part Number	Price £ea.	Description	Req.	Details
1	CHA703	NCA	WINDSCREEN ASSEMBLY	1	

Note: Complete windscreen assemblies are no longer available.

18	AHA7779	£1.03	SHIM, centre rod bracket to body	a/r	

Windscreen Glass

North American models were supplied with a laminated windscreen, while other markets received cars with toughened glass. A laminated windscreen, as its name suggests, is of composite layered construction and while it may crack as a result of a heavy impact, it will not shatter. When under attack from errant road stones, it will usually only sustain small chip damage. The result is that unless it is subjected to a particularly violent blow, you will still have a windscreen to see through. Be aware though that some specific minor forms of damage to a laminated windscreen will still fail the vehicle's roadworthiness test ('MOT' in the UK).

A windscreen made from toughened glass breaks more easily than a laminated item (which is more likely to chip). When it breaks, it is designed to shatter into tiny, relatively harmless particles. Replacing a Sprite/Midget windscreen glass is not an easy task (some windscreen fitting companies refuse to work on Sprites & Midgets). If you have no choice and the windscreen must be replaced, ensure that any other dubious components, such as seals and the frame assembly screws, are renewed at the same time. You only want to do the job once, and a windscreen you've just struggled to reassemble which promptly develops a leak is extremely frustrating (wherever you put your hands on the steering wheel, the drips always land on them and run up your arms!).

Also give careful consideration as to which type of glass you are going to use. If you have already dismantled your windscreen frame, you will be aware of how difficult it can be to remove the assembly screws. Often they have to be drilled out and the holes retapped. Insurance for the future, if you should be so unlucky as to have to do the job again, apply anti seize compound or copper grease to the threads of the new screws before fitting them.

20	AHA8008	£78.00	WINDSCREEN GLASS, laminated	1	clear
	AHA8008OE	£230.00	WINDSCREEN GLASS, laminated, Triplex	1	clear

Sun Visors & Fittings

80	GAC4020	£47.30	SUN VISOR KIT	1	European spec
81	CHA709	£19.44	SUN VISOR, RH	1	
	CHA710	£19.44	SUN VISOR, LH	1	
	CHA64	£19.20	SUN VISOR, RH	1	USA spec
	CHA65	£17.35	SUN VISOR, LH	1	
82	CHA708	£7.06	PIVOT BRACKET, on pillar	2	European spec
	AHH8758	£7.70	PIVOT BRACKET, on pillar	2	USA spec
83	AHH9838	£2.20	STAY BRACKET, on top rail	2	
84	AHH8799	£0.20	WASHER, spherical	2	
85	AJD7721	£0.30	WASHER, Thackery	2	
86	GHF220	£0.14	NUT, nyloc	2	
87	AHH7138	NCA	RIVET, bracket to windscreen frame*	8	
88	GHF422	£0.35	SCREW, alternative to rivet**	8	

*Note: 'Pop' rivets are the original hardware to hold the brackets, but unless you have the right shaped rivet gun, fitting them may become a nightmare. It is difficult to apply them tightly and even more difficult to drill them out again when they go wrong! It hardly needs saying, but - be careful when drilling holes in the windscreen frame to take the brackets (replacing the glass is not at all easy).

**Note: The original 'Pop' rivets are NCA. The screw, GHF422, should be used as an alternative. Our sun visor kit, GAC4020, comes with the screws as standard.

Bonnet & Fittings

Bonnet

ill.	Part Number	Price £ea.	Description	Req.	Details
1	CZJ380	£543.00	BONNET*	1	G-AN4, G-AN5, To G-AN6-183739, H-AN9, H-AN10, A-AN10 From G-AN6-183740
	MS56	NCA	BONNET, aftermarket	1	
	CZJ704	£543.00	BONNET*	1	
3	MS12A	NCA	FRONT REPAIR, bonnet, (inner)	1	

*Note: There are two main differences between the two bonnet assemblies. CZJ380 has been manufactured as a semi-universal component and as such will fit all Sprites & Midgets up until half way through the Midget 1500cc production. It includes provision to fit all three styles of bonnet stay: Left hand mounted stay rod (used on models earlier than those detailed in this catalogue), right hand mounted stay rod and right hand mounted telescopic stay. It will, however, only accept the early style of front corner buffers (item number 4). The bonnet intended for later Midget 1500's, CZJ704, includes the bracket to fit the telescopic stay only. The later style of front corner buffer (illustration no. 6) must be used on this bonnet.

4	AHA5654	£4.57	BUFFER, front corner	2	G-AN4, G-AN5, To G-AN6-183739, H-AN9, H-AN10, A-AN10 From G-AN6-183740

24	GHF500	£0.14	SPLIT PIN	1	
25	AHA5617	£4.21	BRACKET, safety catch	1	
	AHA5617SS	£10.00	BRACKET, safety catch	1	stainless steel
26	53K126	£0.44	SCREW	2	bracket to bonnet landing panel
27	WL700101	£0.14	WASHER, locking	2	
28	GHF306	£0.20	WASHER, plain	2	

Bonnet Lock

Two types of bonnet release cable were used on Spites & Midgets. Until 1978, the cable was fitted with a round knob and was routed through the left hand footwell. It was secured to a bracket on the inner side panel of the footwell, just above the position where the parcel shelf would be on right hand steering cars. Post-1978 Midgets were fitted with a 'T' handled cable which ran along the other side (the engine side, not the cockpit side) of the left hand footwell inner side panel. The knob was located in a hole on the outward facing trim panel (incidentally known as the 'front engine liner') under the centre of the fascia.

78	GWS219	NCA	SEALING TAPE, door apertures*	a/r 60 metre roll x 4 1/2" wide

*Note: Several methods are used by motor manufacturers to attempt to prevent ingress of dampness into the passenger compartment, once it has found its way into the door shell. When the vehicle involved is a convertible, this may seem a little like King Canute ordering the tide to go out. However you can at least prolong the life of your new door trim panels (which are backed by water absorbing, easily distorting hardboard) if you insulate them from the dampness in the door shells by covering the door frame apertures with sealing tape (commonly known as ‘duct tape’).

79		NCA	TRIM PANEL, (liner), door	see page 208
80	GHF1232	£0.34	CLIP, liner to door	18

	GLZ118Z	£3.50	HANDLE, door pull, black, aftermarket	2
96	RMP310	£0.60	SCREW, handle to door*, (chrome)	4

*Note: For many years, replacement doors have not included the captive nuts into which these screws are fitted. Instead the doors are built to later specification to accommodate the handles and screws listed below. This means that there are two square holes in the centre of each door frame into which the plastic ‘Locknut’ nuts (item number 99) must be clipped. The original screws will work in these ‘Locknut’ nuts.

'Stainless Steel' Quarter Light Components

51	ZKC3317	£1.90	SCREW, (flanged), handle to regulator	2	alternative to CZA7194
52	17H6679	NCA	'TORX' KEY, (tool for fitting ZKC3317)	1	

Quarter Lights

There were three types of quarter light assembly originally fitted, see below for details. All types are interchangeable as assemblies only. We are only able to supply complete assemblies for the late type manufactured in stainless steel and featuring straight handles. These can be fitted to earlier cars if required.

(To G-AN4-64474; to H-AN9-75702):

Chrome quarter light frame with curved locking handle.

(G-AN4-64475 on; to G-AN5-121649; H-AN9-75703 on; H-AN10; A-AN10):

Chrome quarter light frame with straight locking handle.

(G-AN5-121650 on; G-AN6):

Stainless steel quarter light frame with straight locking handle.

Floor & Rear Inner Panels

Main Floor Components

ill.	Part Number	Price £ea.	Description	Req.	Details
1	CZJ177	£24.50	INNER SILL, LH	1	to fit models with either 1 2 or 4 jacking points
	CZJ176	£24.50	INNER SILL, RH	1	
	MS32L	£17.60	INNER SILL, LH (aftermarket)	1	
	MS32R	£17.60	INNER SILL, RH (aftermarket)	1	
2	AHA7305	£11.80	REINFORCEMENT, LH	1	'B' post to wheel 1 arch and inner sill
	AHA7304	£11.80	REINFORCEMENT, RH	1	
3	AHA7202	£187.80	FLOOR PAN*	1	

*Note: The floor pan assembly is manufactured to the Midget 1500cc specification - in other words, it has a hole centrally under the transmission tunnel area to allow access to the bolts attaching the propshaft to the 1500cc model gearbox drive flange. The 1275cc propshaft differs in that it has a sliding spline joint in to the tail of the gearbox, which is quite difficult to fit, given no hole in the floor to put your hand through (it's usually done by guiding the front yoke with a long loop of rope held at the rear of the transmission tunnel).

It follows then that it would actually be quite advantageous to fit the 1500cc spec. floor panel on a 1275cc car, since with the extra access hole it will considerably ease the task of propshaft servicing in the future. It also means that the rear oil seal of the gearbox can just about (with some degree of skill !) be replaced without having to remove the gearbox from the car - oil seal replacement is not an uncommon job on the 'A' Series gearbox.

			(Fuel tank sender unit harness in boot floor).		
	602037	£1.00	GROMMET	2	G-AN6 (Rear fog guard harness in boot floor).
					(optional fitment)

Body Plugs & Grommets

A plug blanks off a (temporarily or otherwise) unused hole. A grommet seals the gap between the hole and an item which passes through it. It may also be used, for instance, to stop wires chafing on a sharp metal edge. There are two types of grommet: one has a hole moulded into it, while the other is a diaphragm grommet, which as its name suggests has an easily pierced diaphragm in the centre allowing it to be used as a plug or a grommet as required.

Exterior

60	AAA1645	£0.65	GROMMET	2	G-AN4, G-AN5, (Bumper bracket in front valance).
61	13H8998	£0.82	PLUG, mirror holes in door	a/r	If mirror not used

134 AAA1524	£5.00	CLIP, stay rod stowage	1	
135 AB606031	£0.25	SCREW, clip to boot lid	2	
140 AHA9716	£14.70	TELESCOPIC STAY, boot lid	1	
141 SH604051	£0.20	SCREW	2	From G-AN5-89501, G-AN6, From H-AN10-86301, A-AN10
142 GHF300	£0.14	WASHER, plain	4	
143 GHF221	£0.30	NUT, nyloc	2	

Decals, Plates & Transfers

Note: Please see the Accessories section for further details of decals, plates and transfers.

Many different decals & plates were fitted to Sprites & Midgets during their production life. The meaning or usefulness of the plates varied from critical (for instance chassis plates) to informative (component manufacturers' identifications and names).

The following is a listing of the decals and plates by area of fitment to the car, qualified by application notes when different products were used on different specification models. For the greater part of this section, application notes can only be of a fairly vague nature, usually change points are shown here by year (and these can only be regarded as approximate), because there are no records available to detail precisely when particular decals were fitted.

Chassis number plates & Engine number plates are supplied blank; i.e. printed with the correct design (where relevant) but with the areas for your own vehicle's identification numbers left unfilled.

Chassis Number Plates

ill.	Part Number	Price £ea.	Description	Req.	Details
	CRCP310	£3.71	PLATE, chassis no., 'MG Car Company'	1	Midget (To 1969)
	CRCP379	£12.70	PLATE, chassis no., 'Austin'	1	Sprite (To 1969)
	CRCP339	£4.78	PLATE, chassis no., 'Austin Morris Group'	1	Sprite/Midget (1970-On)

Engine Number Plate & Decals

CRCP343A	£1.70	PLATE, engine no.	1	All 1275cc engines
CRST134	£1.14	DECAL, rocker cover, 'MG'	1	Midget engines (To 1970)
CRST136	£2.90	DECAL, rocker cover, 'Austin'	1	Sprite engines (To 1970)
CRST137	£1.80	DECAL, rocker cover, 'Weslake Patents'	1	all engines (Up To 1970)
CRST126	£0.98	DECAL, rocker cover, 'British Leyland'	1	all engines (From 1970-77)
CRTR202A	£3.10	TRANSFER, front air cleaner, 'Coopers'	1	all engines (To 1971)
CRTR202B	£2.10	TRANSFER, rear air cleaner, 'Coopers'	1	
CRST119	£1.10	DECAL, both air cleaners, 'Unipart'	2	1275cc engines (From 1971)
CRST156	£2.45	DECAL, ignition coil, 'Lucas HA12 type'	1	all 1275cc engines
CRST255	£3.70	LABEL SET, HT lead numbering	1	all engines

Under Bonnet Decals

CRST124	£1.33	DECAL, screen washer, 'Tudor'	3	round containers only
CRST191	£2.84	DECAL, battery, 'Lucas'	1	1960's fitment
CRCP302	£2.20	DECAL, heater box, 'Smiths'	1	(1967) heaters only
CRST130	£0.55	DECAL, heater box, 'Smiths'	1	(1968-76)
CRST129	£0.98	DECAL, heater box, 'SI', (Smiths Industries)	1	(1976-On)
CRST128	£1.10	DECAL, fan motor, 'Direction of rotation'	1	all heater fan motors
CRCP303	£2.75	PLATE, heater box, 'Caution'	1	(1967) heaters only
		(Drainage instructions).		
CRST127	£0.94	PLATE, heater box, 'Caution'	1	(1968-On)
		(Drainage instructions).		
CRST166	£0.94	DECAL, bonnet landing panel, 'Unipart'	1	(1975-On)
		('Important' (replacement parts instructions).		
CRST113	£1.24	DECAL, bonnet landing panel	1	(1968-74)
		('Important this vehicle is wired neg. earth').		
CRST115	£1.33	DECAL, bulkhead	1	(1975-On)
		('Important warning this vehicle is wired negative earth').		
CRST117	£1.55	DECAL, bulkhead	1	(1970-74)
		('Warning do not run engine with battery disconnected').		
CRST118	£1.33	DECAL, radiator cowling	1	(1968-On) (cross flow
		('This plug must not be removed when engine is hot').		radiator fitted models)
		DECAL, radiator cowling	1	(1968-On)
		('Bluecol - do not drain').		

Electric Fuel Pump

CRST212	£2.24	TAPE, self adhesive, ('SU. guaranteed factory Replacement unit').	1	(1967-74) (1275cc models only)
---------	-------	---	---	-----------------------------------

Interior of Car

CRST123	£3.70	TRANSFER, speedometer face ('Important when resetting trip counters').	1	all models
CRST125	£1.60	DECAL, windscreen, 'Triplex Laminated'	1	models fitted with laminated screen
CRST114	£1.33	DECAL, hood header rail, 'LIFT HERE' (Hood release instructions).	1	all models
CRST170	£2.24	PLATE, fascia, 'Midget 50th Anniversary'	1	(1979 models)

Tax Disc Holder

For owners of Sprites & Midgets outside the British Isles, the tax ('road fund licence') disc holder is not required. However, it makes an ideal holder for a car park pass or permit, while giving your British sports car that extra little authentic touch.

CRLH400	£4.06	TAX DISC HOLDER, 'MG' Logo	a/r	brown on cream
CRLH401	£3.71	TAX DISC HOLDER, 'MG' Logo	a/r	gold on black
TDH103	£1.80	TAX DISC HOLDER, 'MG' Logo	a/r	black & red
TDH101	£1.80	TAX DISC HOLDER, 'MG' Logo	a/r	gold & red
CRLH419	NCA	TAX DISC HOLDER, 'Austin Healey Sprite'	a/r	red & gold on black
CRLH402	£4.84	TAX DISC HOLDER, 'BMC', (four colours)	a/r	rosette motif on black
CRLH407	NCA	TAX DISC HOLDER, 'University Motors'	a/r	gold on blue

Radiator Grilles (1967-69)

Front Grille & Body Mouldings

Note: Please see the Accessories section for full details of badge bars & badges.

Radiator Grille (1967-69)
(G-AN4 and H-AN9)

ill.	Part Number	Price £ea.	Description	Req.	Details
1	ARA249	NCA	GRILLE	1	G-AN4
2	ARA1208	£3.00	GRILLE SLAT, outer, RH	1	
	ARA1209	£3.00	GRILLE SLAT, outer, LH	1	
4	ARA1215	£3.00	GRILLE SLAT, (second from end), RH	1	
	ARA1216	£3.00	GRILLE SLAT, (second from end), LH	1	
6	ARA1210	£3.70	GRILLE SLAT, inner	32	
7	ARH596	£0.76	CLIP, slat to frames	76

83	RA608176	£0.80	RIVET, side finishers to front wings	6	

Radiator Grille (1975-On)
(G-AN6 models)

90	CHA478	£27.40	GRILLE, mild steel	1	G-AN6
	CHA478SS	£52.80	GRILLE, stainless steel	1	
91	GHF423	£0.20	SCREW, grille	6	
92	PWZ203	£0.12	WASHER, plain	6	

Body Mouldings

Until 1970, Sprites did not wear any body mouldings. Midgets of that period however, used both upper side mouldings (waist) and a large centre moulding on the bonnet (although the bonnet moulding was theoretically deleted from 1969 production). All of these types of moulding were dropped for the 1970 model year. Instead all Sprites and Midgets from that point onwards were fitted with long, one piece

mouldings to visually separate the satin black sills from the colour of the rest of the body. Midget 1500cc's went one step further, using extra short mouldings on the lower rear quarters of the rear wings (below which the wings were painted satin black), the purpose being to join the thick black lines of each sill to the similarly thick black side profile of the rear rubber bumper. All of the different types of bright finished body mouldings on Sprites & Midgets are water traps. The panels to which they are attached should be suitably treated to retard the progress of the dreaded 'tin worm'. Ideally, the holes for fixing the mouldings should be pierced in the panels prior to paint finishing. This does not always happen, a hole is often drilled through a painted panel and a fastener inserted without any form of corrosion protection on the exposed raw steel around the edge of the hole. Applying Waxoyl products both in the hole and, on the fixing before and after installation should help. Any excess can be easily wiped away with a rag moistened with a suitable solvent such as white spirit.

Bonnet Centre Moulding
(To G-AN4-66225 Only)

100	14A7074	£61.80	MOULDING, bonnet centre	1
101	14A7074FK	£10.20	FITTING KIT, bonnet moulding	
102	AHA5700	£2.45	STUD PLATE, front two positions	2
103	AHH6360	£0.60	STUD PLATE, centre position	1
104	WL700101	£0.14	WASHER, locking, (front three positions)	3
105	GHF206	£0.08	NUT, front three positions	3
106	AHA6257	£3.44	STUD PLATE, second rearmost position	1
107	AHA5702	£2.24	STUD PLATE, rear position	1
108	WL700061	£0.20	WASHER, locking, (rear two positions)	2
109	NH806011	£0.18	NUT, rear two positions	2

Upper Side Mouldings
(G-AN4 only)

115	AHA5825SET	£131.20	WING MOULDING SET, upper side	1	waist mouldings
116	AHA5825SFK	£31.60	FITTING KIT, wing moulding set	1	
117	AHA5825	£20.60	MOULDING, front wing	2	
118	AHA5824	£19.80	MOULDING, door, LH	1	
	AHA5823	£19.80	MOULDING, door, RH	1	
119	AHA5818	£21.50	MOULDING, rear wing*	2	

*Note: When a moulding is fitted to a new rear wing, ensure that it runs level and in line with the front wing and door mouldings, from the 'B' post back to approximately half way along the rear wing. From this point, it should adopt a slight downward curve to finish with its top edge level with the joint between the two lenses of the rear lamp unit. To achieve this, the curve can be gently set into the moulding by hand when installing.

The fixing holes are of course critical to the final placing of the trim. The height and position of these holes can be determined by sticking a line of masking tape to the panel and adjusting it until it is visually satisfactory (if you run the masking tape on a dead straight line from one end of the rear wing to the other, stand back from the side of the car and you will see why it should have a curve in it). The masking tape will also serve as paint work protection while the fixing holes are being drilled in the panel.

120	AHA9447	£1.24	STUD PLATE, front end of front wing	2
121	AHA9447	£1.24	STUD PLATE, centre of door	2
122	AHA9447	£1.24	STUD PLATE, rear end of rear wing	2

Rear Bumper, Fittings & Mirrors

Rear Bumpers & Number Plates

When fitting bumpers to a car, note that there is potentially a lot of scope for adjustment between the bumper blade, spring bar, the assorted bracketry and the car body - many of the bolt holes are elongated for this purpose. It makes sense therefore, to loosely assemble everything on the car and only tighten up the fastenings once you are completely satisfied with the position of the bumper relative to the bodywork. If you cannot position the bumper correctly, replacing the spring bar may help: The spring bar holds the bumper blade to the correct shape. Once again, remember to smear the threads of all nuts and bolts with anti seize or copper grease, if, you want a chance of undoing them in the future.

Wing Mirrors

Strictly speaking, the only wing mirrors of original (factory option) style for 1967 onwards Sprites and Midgets are GAM117 and GAM118, colloquially referred to as 'Boomerang' mirrors after Desmo's well known mirrors of that type. However, the accessory mirrors also offered here will no doubt bring on waves of nostalgia when they add that final, period touch to your newly restored car.

130	GAM117	£34.70	WING MIRROR, 'Boomerang'	2	convex glass
131	GAM210	NCA	MIRROR GLASS, replacement	2	
	GAM118	£34.70	WING MIRROR, 'Boomerang'	2	flat glass
	GAM207T	£6.50	MIRROR GLASS, replacement, tinted	2	
132	WM1904	£12.80	WING MIRROR, 'Lucas', RH	1	convex glass
	WM1905	£12.80	WING MIRROR, 'Lucas', LH	1	
	WM1906	£12.60	WING MIRROR, 'Lucas', RH	1	flat glass
	WM1907	£12.60	WING MIRROR, 'Lucas', LH	1	
133	GAM105	£13.00	RACING MIRROR	2	

Door Mirrors

Sprites & Midgets from around 1970 onwards were fitted with 'Tex' door mirrors in preference to wing mirrors; as a rule the driver's side mirror would be a standard feature, while the passenger's side was optional.

Bright finished mirrors were specified for both chrome & rubber bumper fitted cars, whereas the black finished mirrors appeared to be more at home on the rubber bumper models. Note that the replacement 'Tex' mirror now available is not exactly the same as the original in the method by which it mounts on the door - an extra hole may have to be drilled (the redundant hole being covered by the mirror plinth anyway).

Owners of pre-1970 cars who prefer door mirrors to wing mirrors will find that the Triumph item listed below, while being non-original to Sprites & Midgets, compliments the ornate style of the earlier cars rather well.

140	GAM216A	£25.30	DOOR MIRROR, 'Tex', LH	1	bright finish
	GAM215A	£25.30	DOOR MIRROR, 'Tex', RH	1	
	GAM262X	£23.00	DOOR MIRROR, 'Tex', LH	1	black finish
	GAM261X	£23.00	DOOR MIRROR, 'Tex', RH	1	
142	GAM208T	£6.50	GLASS, tinted, (convex)	a/r	for 'Tex' type door mirrors
	GAM207T	£6.50	GLASS, tinted, (flat)	a/r	
143	DZB5208A	NCA	WEDGE PLATE	a/r	for original 'Tex''mirrors only
143a	CZA7164K	£6.50	WEDGE KIT, (plastic)	a/r	
144	GHF405	£0.25	SCREW, wedge plate to plinth	a/r	
145	CZH3521Z	£11.00	PLINTH, chrome finish	a/r	
	HMP290052	NCA	PLINTH, black finish	a/r	use when mirrors are not fitted period 1960's style
146	CZH3525	NCA	MOUNTING PLATE, plastic	a/r	
147	SM105161	£0.70	SCREW, plinth & plate to door	a/r	
148	13H8998	£0.82	PLUG, mirror holes in door	a/r	
149	622352	£25.30	DOOR MIRROR, 'Triumph' type	a/r	

Hood, Frame & Fittings

Hood Fasteners (Fitted To Body)

The fasteners listed here are used to hold the hood, hood cover and optional tonneau cover and all were fitted to every car, whether the tonneau was specified or not. The studs on the hood retaining strip (see item 75 on this page) also held the hood cover & tonneau cover.

Ill.	Part Number	Price £ea.	Description	Req.	Details

Hood & Hood Frame

Now to blow apart a few myths of the classic motor trade. The original material used for hood manufacture was 'Everflex'. Internally lined in grey fabric (black from 1969-On), it was replaced by a fire resistant material known as 'BLS22 CF019WFR' in 1972, pending forthcoming safety regulations. The new material was recognisable by the diamond pattern on the interior lining. There may be odd off-cuts lying in dusty trim shop stores somewhere, but essentially there is none of this hood material left. Due to the non-availability of the original hood material, the best quality hoods are now produced from ICI's 'V818' double lined material. This excellent material (the only replacement material which tailors like the original) is only discernible by experts and, has been for some time, the factory fitted hood material for sports cars other than Sprites & Midgents.

All of the hoods here use 'Vybak' windows and are constructed on the original jigs (ensuring the greatest accuracy) with all fasteners ready fitted. They may be ordered either with or without fitted header rail. Contrary to the belief of some, Sprites & Midgents from 1967 onwards had only one hood colour - black. This is still the only colour available. Hood design remained the same from 1967 through to 1979, with the exception of one small detail - from 1969 onwards a Velcro strip replaced the furthestmost forward Tenax fastener on each rear quarter of the hood. This later (& more widely used) hood with Velcro is the type usually found on sale today. If you wish to use this hood on a 1967 or 1968 car, two extra Tenax fasteners will have to be ordered. The same situation also applies to tonneau covers & hood covers (which of course fasten to the same area of the car's body work).

Hood & Header Rail

36	CHA86	£495.00	HOOD, black, (with header rail fitted)	1

92	GHF332	£0.20	WASHER, locking	6	tonneau cover nor
93	GHF301	£0.13	WASHER, plain	6	hard top are fitted
94	AHA8082	£11.90	BRACKET, (tonneau rail/hard top)	2	
95	SH605091	£0.70	SCREW, (bracket & hood frame to body)	4	use when tonneau cover
96	GHF103	£0.42	SCREW, (hood frame to body)	2	or hard top are fitted
97	GHF332	£0.20	WASHER, locking	6	
98	GHF301	£0.13	WASHER, plain	6	

114	7H9864	£0.60	SILVER BUTTON, 'durable dot'	13
115	7H9866	£0.22	METAL SOCKET, 'durable dot'	13
120	AHA8324	NCA	STOWAGE BAG, hood cover	1

**Hood Fastener Tools**

The tools listed will prove invaluable to anybody intending to replace the fasteners in their weather equipment. That said, the tools are also useful for fitting similar fasteners in non-motoring applications like clothing or camping equipment!

The simplest of tools make light work of a job - for example, the two piece tool for fitting the durable dot fasteners. The base and punch set was made available in the marketplace due to continued demands from owners attempting to fit replacement fasteners. The tricks used before the public availability of the tool set ranged from screwdrivers & pin punches to pointed hammers and ball bearings. Trim manufacturers have more exotic tools for this task, such as special jawed pliers that will install the fastener in one squeeze, without having to first pierce the location hole. Needless to say this type of equipment is expensive and beyond the requirement of the home user.

125	GAC5063X	£1.14	FITTING KEY, 'Tenax'	a/r	button/socket
126	GAC5060X	£5.00	FITTING KIT, 'durable dot'	a/r	

**Hood Cover**

Hood covers are supplied with all fasteners ready fitted. They are only available in black (as original).

	AHA8288	£273.20	COVER, hood stowage	1	
			(With fasteners - no velcro strips).		
	TFS106	£2.50	FASTENER, 'Tenax', (cockpit side)	8	
	552964	£4.43	FASTENER	8	To G-AN4-66225,
	551684	£1.03	FASTENER NUT	8	To H-AN9-77590
	7H9864	£0.60	SILVER BUTTON, 'durable dot'	13	
	7H9866	£0.22	METAL SOCKET, 'durable dot'	13	
110	CHA93	£283.50	COVER hood stowage, (Vinyl)	1	
	CHA93D	NCA	COVER hood stowage, (Double Duck)	1	
	CHA93X	NCA	COVER hood stowage, (Mohair)	1	
			(With fasteners - with velcro strips).		G-AN4-66226 On,
111	TFS106	£2.50	FASTENER, 'Tenax', (cover to cockpit side)	6	G-AN5, G-AN6,
112	552964	£4.43	FASTENER	6	H-AN9-77591 On,
113	551684	£1.03	FASTENER NUT	6	H-AN10, A-AN10

Tonneau Covers

The usual way of defining changes (by chassis no.) does not work here, because of the number of owners who have fitted head restraint type seats to cars which previously didn't have them, or have changed the style of head restraint. Thus you will have to compare the descriptions below against the specification of your car before ordering. For more information on head restraint styles, see pages 210 & 211.

The tonneau covers listed here are supplied with fasteners ready fitted. Originally the non-Velcro fitted cars were those with an extra 'Tenax' fastener on each side (i.e. prior to 1969, or to G-AN4-66225 and H-AN9-77590).

The two types of tonneau rails have differing kinks in them to fit behind pre-1969 or 1969-on seats. Beware if you have upgraded your early car to later seats. The covers are only available in black (as original). For details concerning the fittings on the car body to which the tonneau cover is attached, please see 'Hood, Frame & Fittings' on pages 234 & 235.

Ill.	Part Number	Price £ea.	Description	Req.	Details

How to fit your Tonneau Cover

Factory original tonneau covers (and those listed on this page) for Sprites & Midgents were (and are) supplied with all the fasteners in place so that they would fit straight out of the bag. This statement will only be true when the car body has all its original fixings in the original places, as jig drilled and assembled by The MG Car Company. To this end, some non-original covers in the marketplace are supplied without fasteners installed to allow the product to be tailored specifically to the vehicle.

When fitting a replacement tonneau cover from another supplier with no fasteners installed, their positioning must be established to ensure a snug final fit. Before starting, check that the correct cover has been obtained (with respect to head restraints, Velcro, etc.). You will also need the correct quantities and types of fixings, tools to fit the fasteners (see items 30 & 31), a hammer & block, a sharp spike or hole punch for piercing, a tape measure and, a Chinagraph pencil for marking positions. If the ambient temperature is low, i.e. below 10° Celsius, the cover should be warmed prior to starting work to keep the material pliable. *An electric fan heater is ideal for this, draping the tonneau cover over the cockpit with the heater working inside will do the trick.

*Note: Moss take no responsibility for damaged caused to tonneau covers damaged by electric fan heaters. Note: 'Measure twice, cut once' is a particularly relevant adage - for all trim installations.

- Establish the centre of the tonneau cover front & rear edges, and mark with the pencil. The front centre is of course the zip. The rear may already be marked, however check it (the easy method is to just fold the tonneau cover in half).
- Find and mark the centre fastener on the cockpit rear edge, and the centre point on the dash top. These must be accurate as they are to be the first fastener positions (providing

the datum for all the others) - unless you are specifically after the 'lop-sided' tonneau cover look!

- C) Measure the distance from the centre rear stud to the centre of a line drawn between the two dash top centre studs. This gives the front to back spacing of the fasteners on the body.
- D) Transfer this measurement onto the tonneau cover, leaving equal spacing from the front and rear edges. These two positions should fall on the double thickness material approximately half-way between the sewn seam and the tonneau cover edge welting.
- E) Use the new measurement to mark the rear fixing position by crossing the centre line previously established.
- F) Measure the distance between the two studs on the dash top and mark this distance equally about the front centre line on the tonneau cover.
- G) Re-measure all actions taken so far, very carefully, and then, check them again.
- H) Fit the centre rear fastener and attach the tonneau cover to the car by it. With the help of an assistant, pull the tonneau cover forward and check again the positioning for the two front fixing positions. The fitted tonneau cover needs to be tight enough when installed not to billow when the car is driven, but not so tight that it would be a struggle to fit.
- I) Pierce two holes through the cover front edge in the correct places and fit it to the front pegs. The cover is now self supporting. Have a cup of tea to celebrate and let the fabric recover its shape. If you have had to warm your cover during work, leave the heater on during your break.
- J) Starting from the middle rear, mark the positions both left & right on the tonneau cover by tracing with the pencil out to the body side, do similarly on the front fasteners. This will give check guidance only when you start to install the fasteners. Do not pierce these marks.
- K) The cover should now look as if it will take proper shape. Trial fit the cover to the car with the help of an assistant to establish where, if any, rucks of excess material may be. The tonneau covers positioning should be such that it will be free from wrinkles & rucks.
- L) If you are satisfied, start piercing and installing fasteners from the middle at the rear, alternately on the left then, the right, pulling the cover into a snug fit as you go & attaching it to the car by each of its new fasteners as they are fitted. Work from side to side and then diagonally, pulling and coaxing the fabric to fit the car. Pulling and trial fitting before the next fastener is installed is important. The required positions of the fasteners may not exactly match those previously marked with the pencil.

Important Note: Do not panic, the tonneau cover fabric will stretch and is now held by the pegs, not your assistant. Concentrate on getting it fitted squarely, equally tensioned and without rucks or wrinkles. The process is a very methodical one and as such, needs approaching slowly if a really professional looking outcome is expected.

Hardtop

A wealth of different hard top styles were (and a few still are) offered for Sprites and Midgets. However, only one was ever offered by the factory. This listing of parts is concerned with the factory hard top only, so any interchangeability between parts shown here and parts for aftermarket hard tops is, as they say in film title disclaimers, purely coincidental (and fortuitous). Don't build your hopes up too high on parts availability here - although there are some pleasant surprises.

iii.	Part Number	Price £ea.	Description	Req.	Details
40	MGH002	£480.00	HARDTOP, fibreglass, black*	1] aftermarket
	MGH002W	£480.00	HARDTOP, fibreglass, white*	1	
*Note: These hardtops are aftermarket reproductions and include fittings. Original fittings cannot be used on these hardtops.

General Hardware & Fixings

Following is a listing of the common fasteners used on classic cars. These fasteners are for general use and are not intended to replace those listed for specific applications elsewhere in this catalogue. To aid identification by terminology, a screw is threaded for its full length. A bolt is only part threaded with a plain unthreaded shank area between the head and the thread. The part number two letter prefix of SH means that the item is a Screw with a Hexagon head. The prefix BH means a Bolt with a Hexagon head. The first number defines the thread type, UNF = 6, UNC = 5. The second and third numbers give the thread diameter in increments of 1/16", e.g. 04 = 1/4", 05 = 5/16", 10 = 5/8". The fourth and fifth digits show the length in increments of 1/8", e.g. 04 = 1/2", 16 = 2", 23 = 2 7/8". The last digit defines finish, 1 = zinc plated. This coding system is only applicable to bolts and screws; nuts & washers are coded by a similar system that follows some of the above principles.

Studs

Studs- UNF

A stud is a length of round bar threaded at both ends. The length of thread at each end of the stud may vary for specific applications. The following list is of studs have fine (UNF) threads at both ends.

Part Number	Diameter	Overall length
TE604081	1/4"	1"
TE604091	1/4"	1 1/8"
TE604101	1/4"	1 1/4"
TE605101	5/16"	1 1/4"
TE605111	5/16"	1 3/8"
TE605121	5/16"	1 1/2"
TE605131	5/16"	1 5/8"
TE605141	5/16"	1 3/4"
TE605151	5/16"	1 7/8"
TE605181	5/16"	2 1/4"
TE605201	5/16"	2 1/2"
TE605221	5/16"	2 3/4"
TE605251	5/16"	3 1/8"
TE605291	5/16"	3 5/8"
TE606101	3/8"	1 1/4"
TE606111	3/8"	1 3/8"
TE606121	3/8"	1 1/2"
TE606141	3/8"	1 3/4"
TE606151	3/8"	1 7/8"

Studs- UNF/UNC

Fine (UNF) threads at one end and course (UNC) at the other.

Part Number	Diameter	Overall length
TE504081	1/4"	1"
TE504131	1/4"	1 5/8"
TE505091	5/16"	1 1/8"
